THE SHELTER

The shelter in its unfolded state may look terrifying to a beginner, but it's simpler to build than it looks.

For best results, crease the fold lines rather than scoring them. Glue tabs, however, can be scored.

Once all the fold lines have been creased and the glue tabs scored, cut out the shelter.

1. Start with the middle strip, and fold it into an arch shape. Next, start folding down the side strips immediately next to the middle strip, gluing each tab into place one at a time. Repeat this process for the outermost strips, and you should end up with something that looks like the image to the left.

THE SHELTER, CONTINUED

2. Fold up and glue the bottom of the shelter into place, as shown to the left.

3. Finally, close off the sides by folding up the round flaps as shown to the left.

The shelter model is now complete.

THE PRIVACY ENCLOSURE

The privacy enclosure is basically a 4-sided cone, and the flattened development looks like a flower. Fold up one “petal” at a time, gluing them to their adjacent neighbors as you go along.

THE RADIATOR

The radiator is a truncated cone, with tabs along the bottom that fold outwards. The top panel is a separate part that you glue on after forming the main part of the radiator. Also included is a bottom plate, which you can use to help it keep its shape if you do not plan to glue the radiator to a tile.

SUPPLY CONTAINERS AND STACKS

The basic supply container is a simple box volume.

The supply container stack is another box volume, and saves you the effort of building 4 supply containers when you just want a stack of them.

EQUIPMENT CONTAINERS AND STACKS

The equipment container is another box volume.

As with the supply container stacks, the equipment container stacks save you the trouble of building 4 equipment containers when you need a stack.

WATER BARRELS AND PALLETS

The water barrels are cylinders, and the pallet is a flat fold-over part.

THE GENERATOR

The generator is a flat-bottomed cylinder, and folds up into the shape shown to the left.

LIGHT STANDARDS

The light standards are 3-part items. The light cluster on top is a flat fold-over part, which is then bent upwards so that each light panel is at an agle. The standard itself is a 4-sided cylinder with flaps along the bottom that fold outwards to form the base.

The light cluster glues to the top of the standard.

As with the radiator, a bottom plate is included to help retain the standard's shape if you do not plan to glue it to a tile.

FINAL ASSEMBLY

The items can then be glued into place permanently on a tile, or you can use removable double-sided tape on the bottom of each item to keep it in place temporarily.
