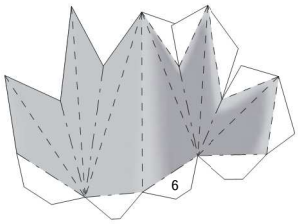
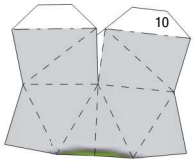
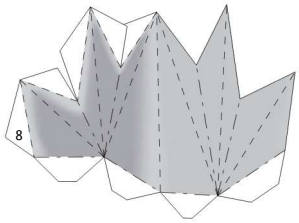
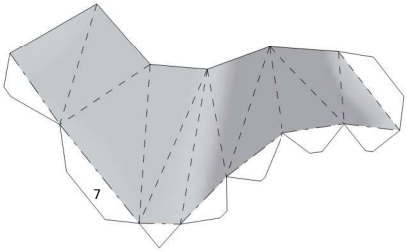
Build by LuIS

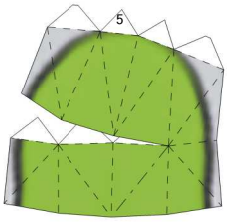
PaPerPokés
www.pokemonpapercraft.net

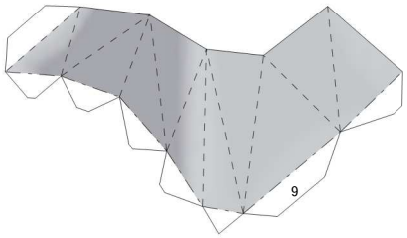




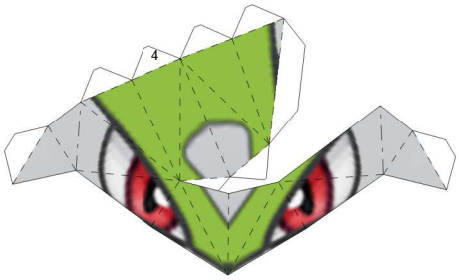


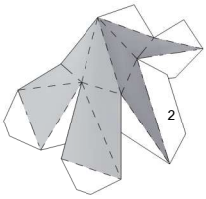


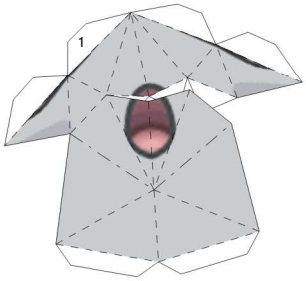


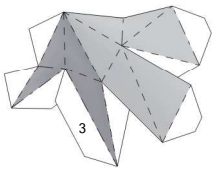


The tips of the ears are the hardest part of the head. Fold the first part of each.

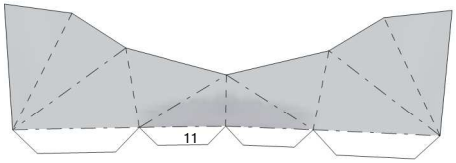


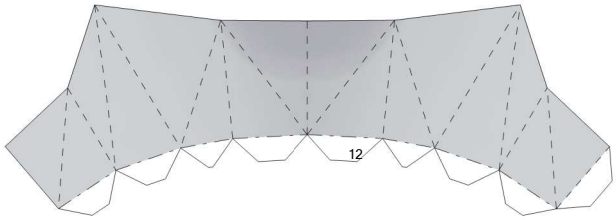


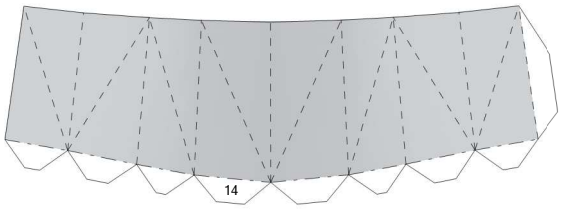


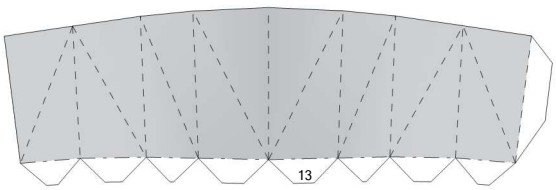


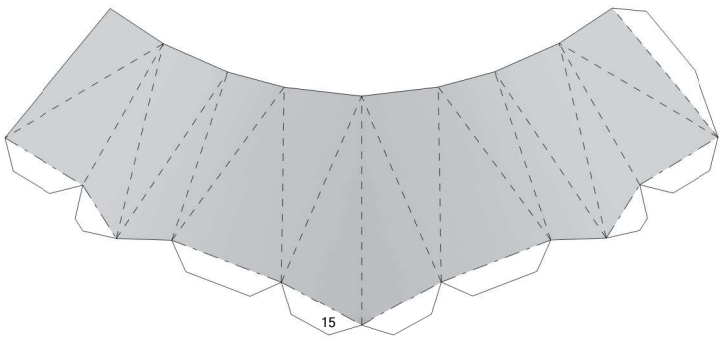
Close the details at the sides of the mouth at the front, at the lower part.

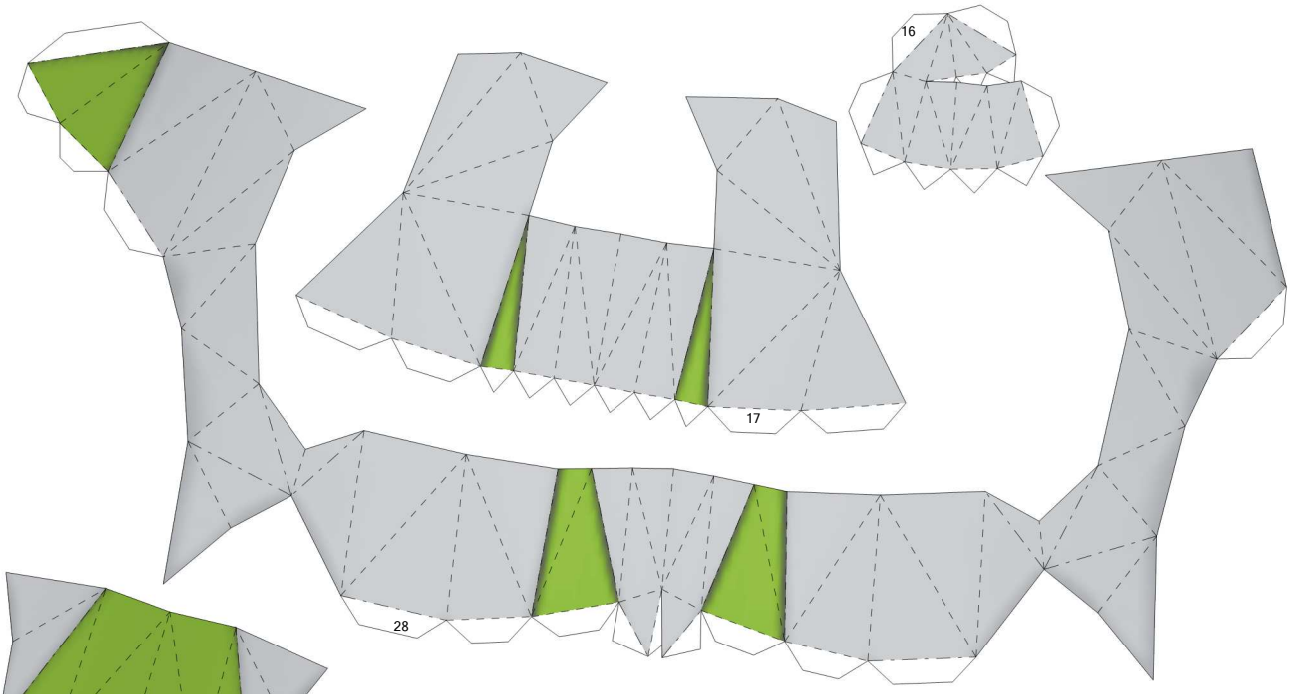


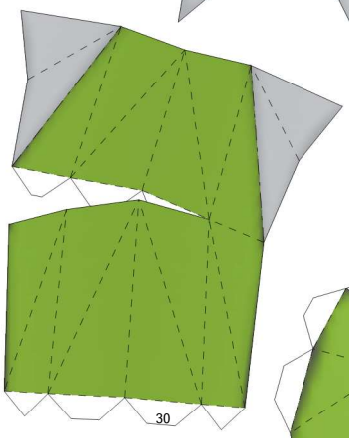


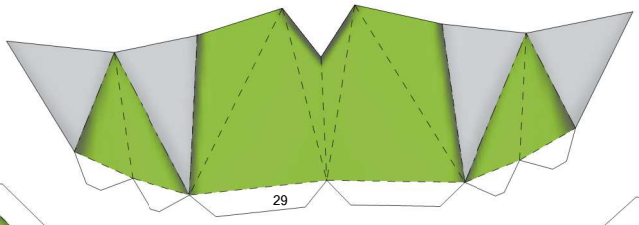


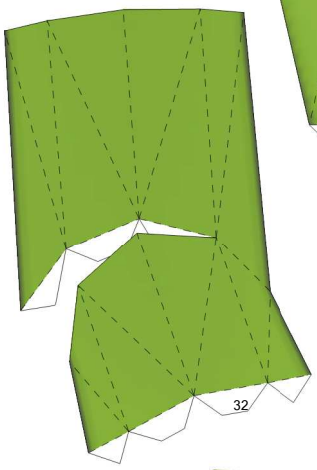


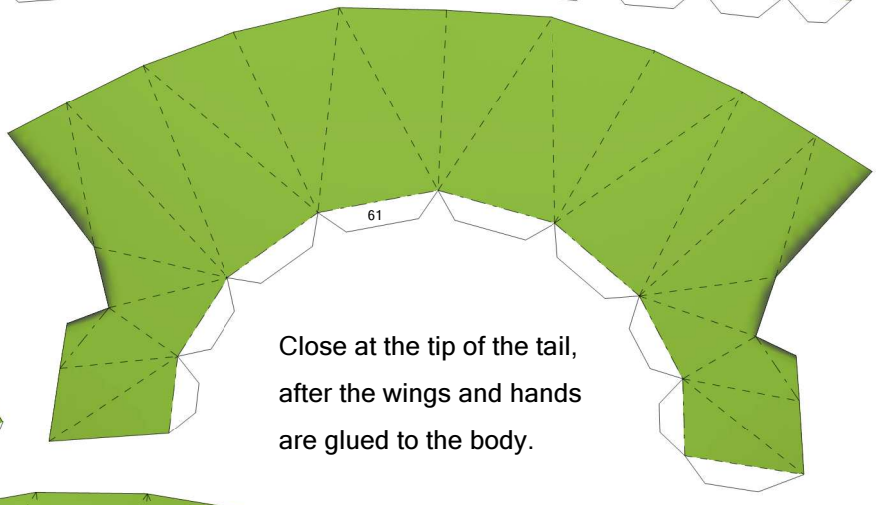




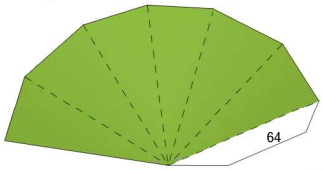


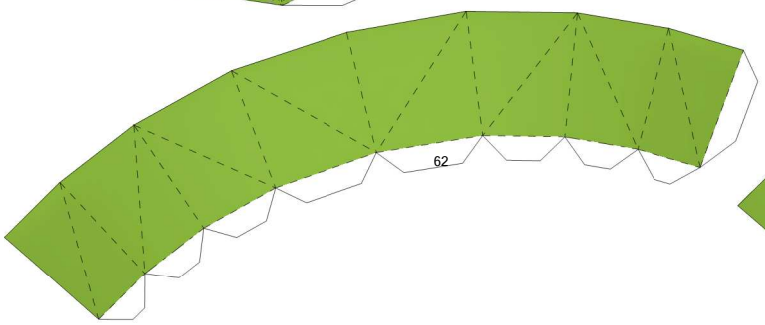


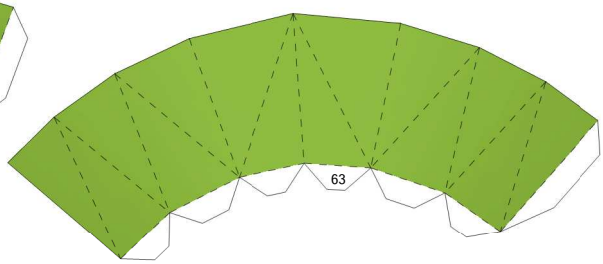




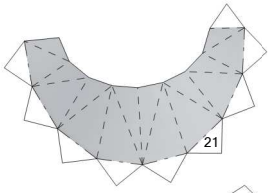
Close at the tip of the tail, after the wings and hands are glued to the body.

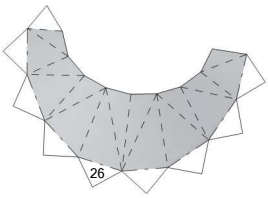


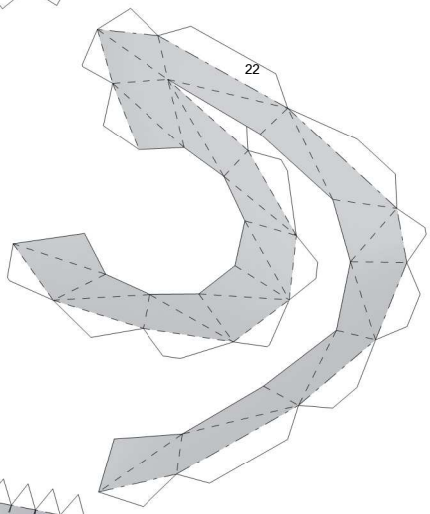


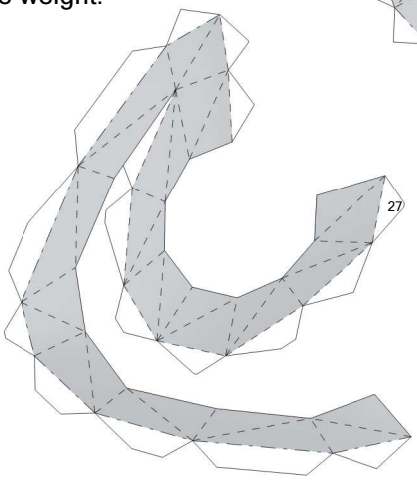


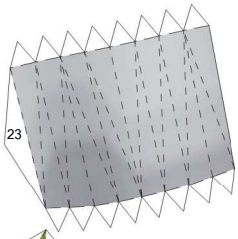
You MUST insert a roll
of paper inside each arm,
in order to stand the weight.



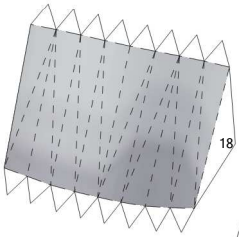


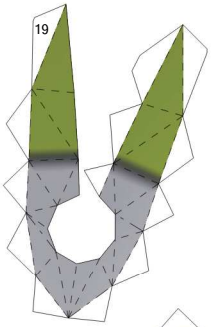


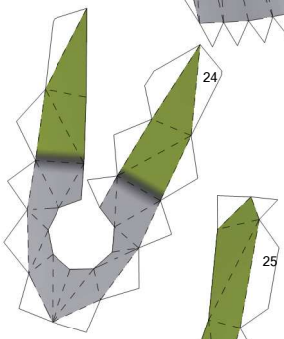


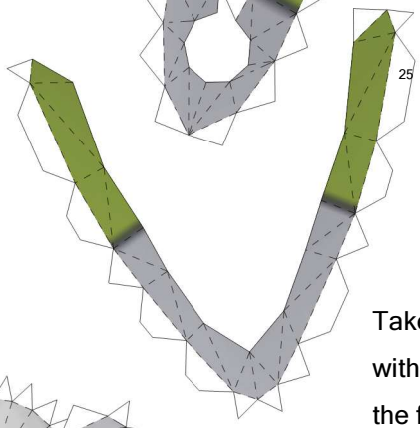


Build the part that
connects to the arms
and the body around
the tubular piece.

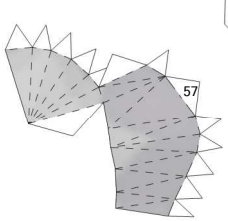


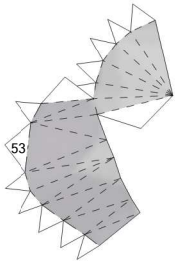


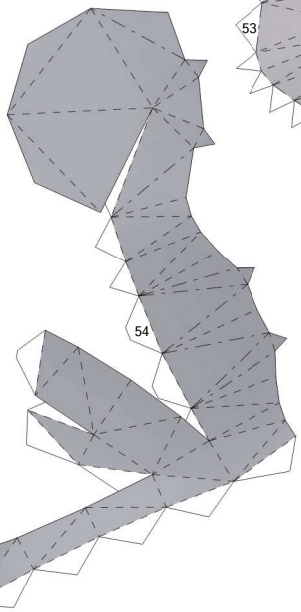


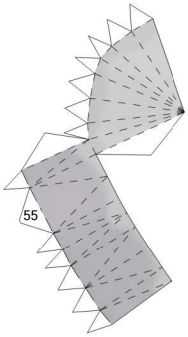


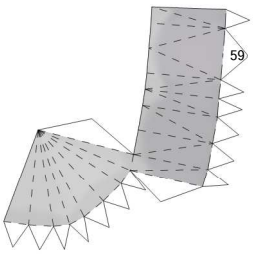
Take your time
with the hands,
the fingers are
small. Tweezers
are indicated.

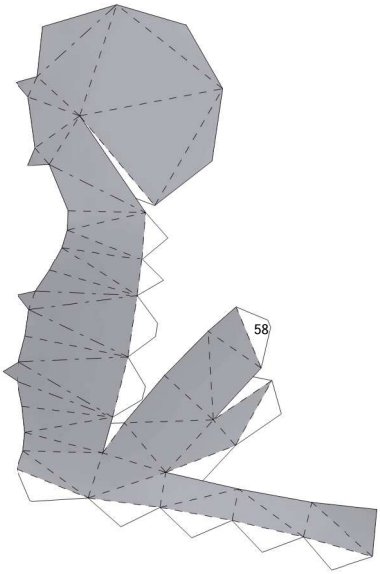


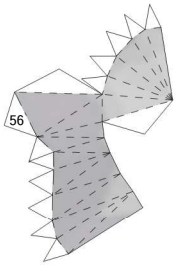


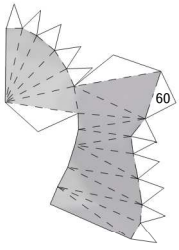


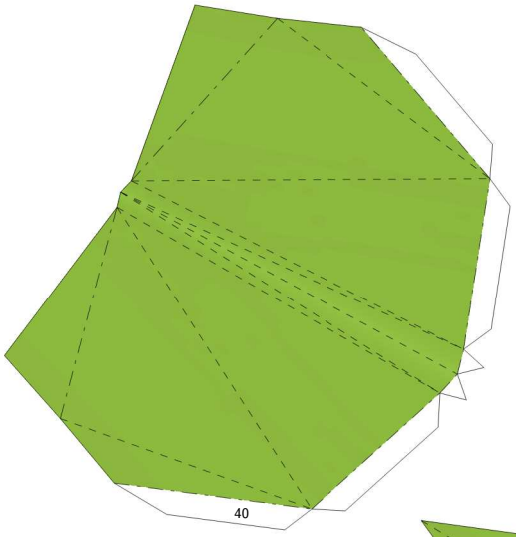


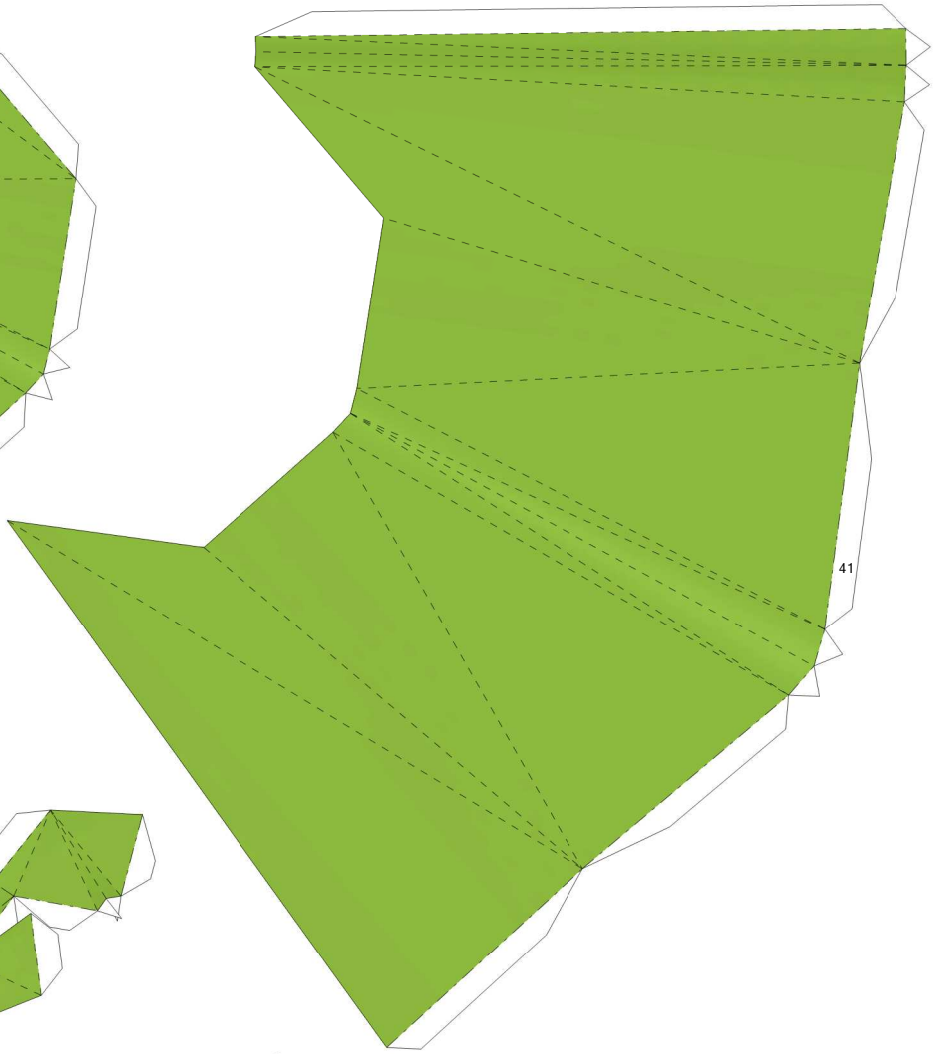


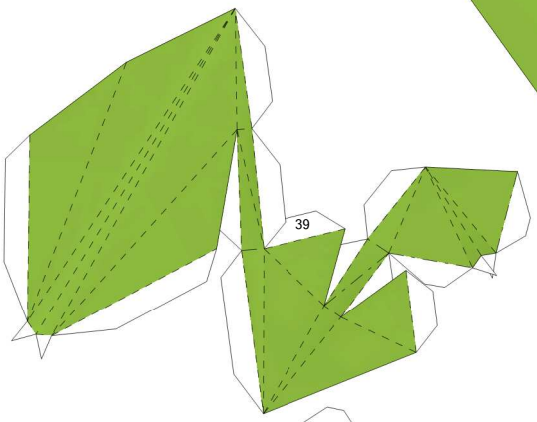


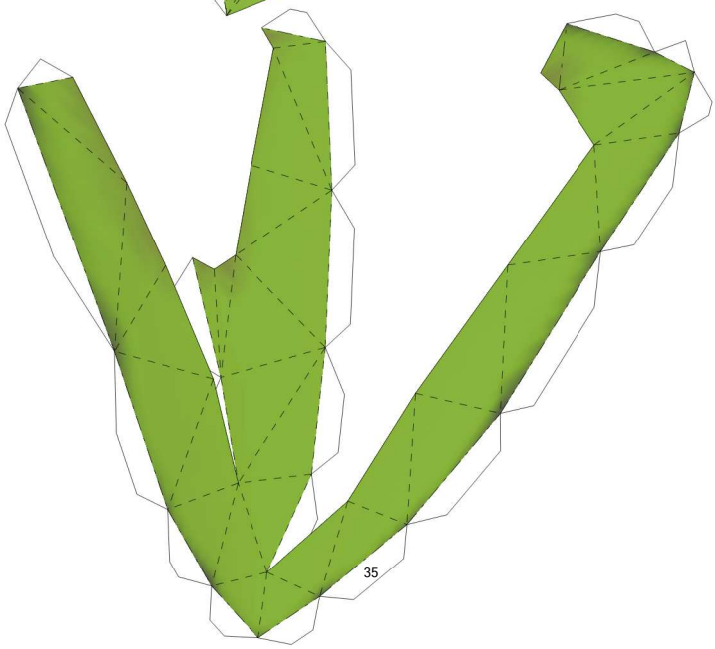


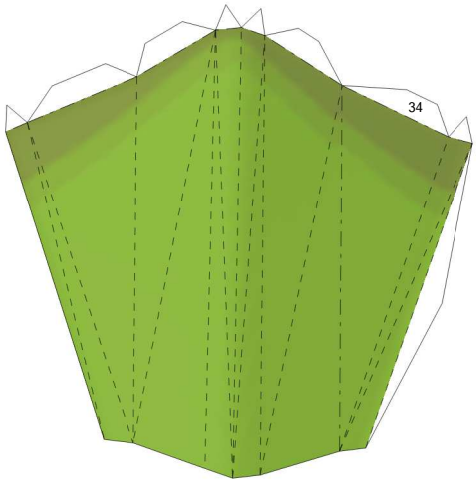


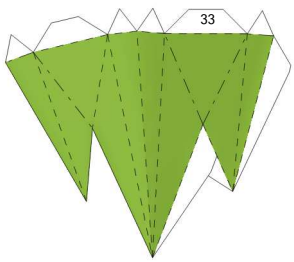








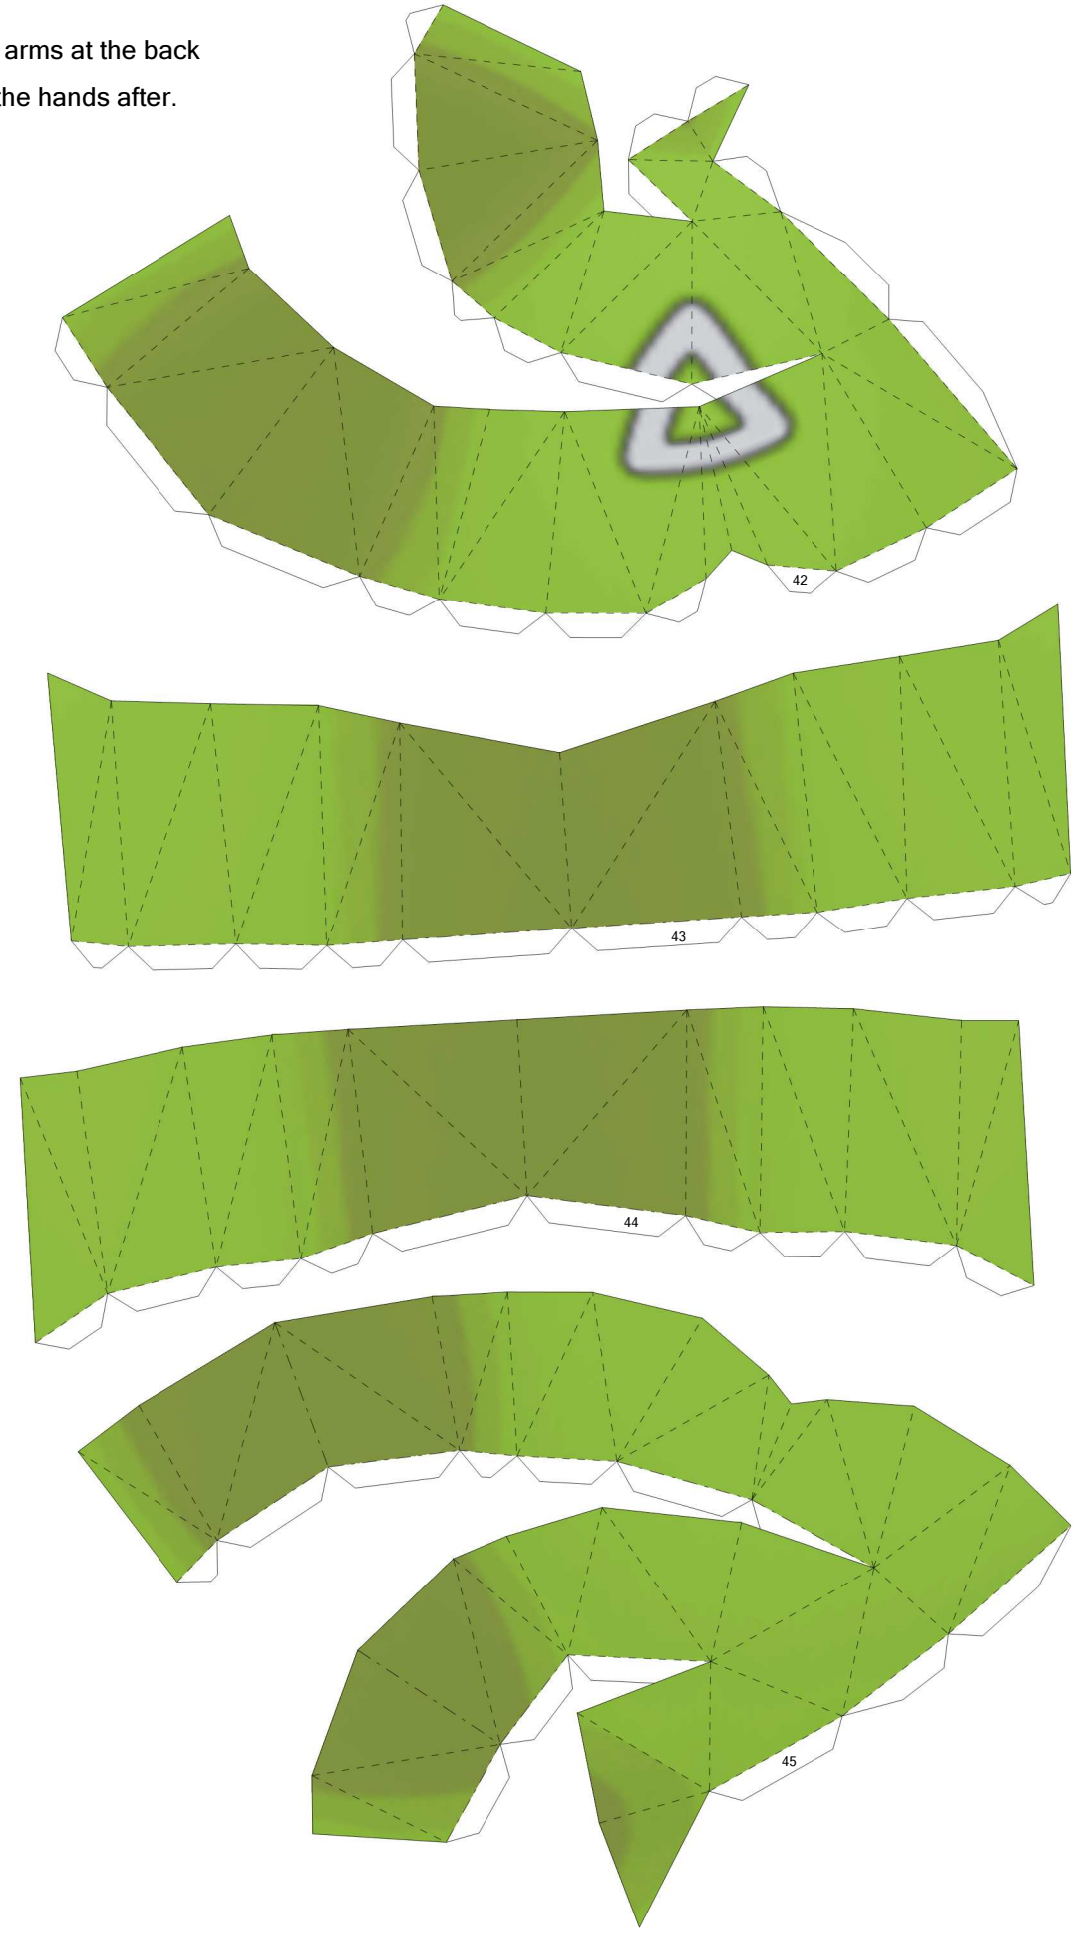


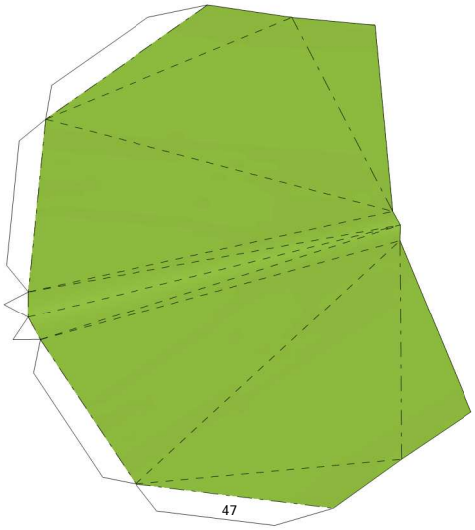


Start the wings by building the spikes. Join them with arm after the 2nd piece of the arm's been glued.

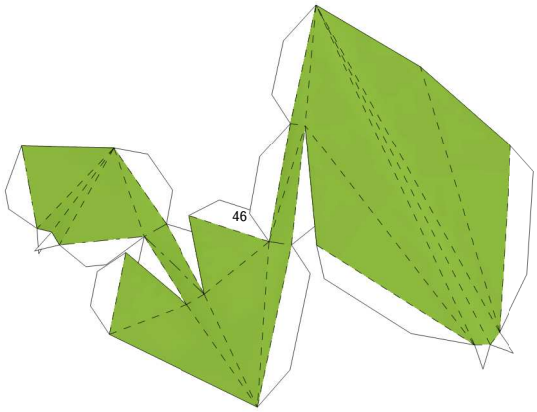
The tip of the "legs" offer the same problem as the ears. Build them the same way and glue them and the part they connect to to the body when the numbers get to them.

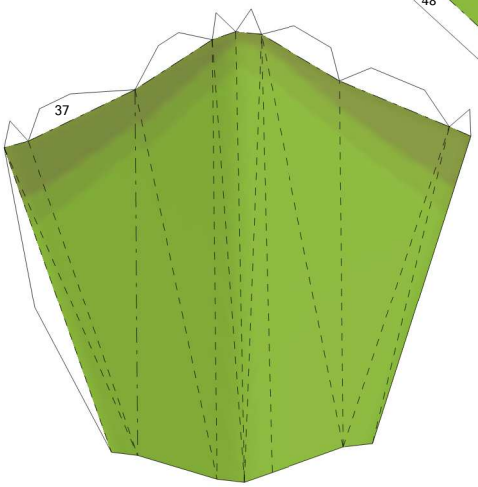
Close the arms at the back
and glue the hands after.

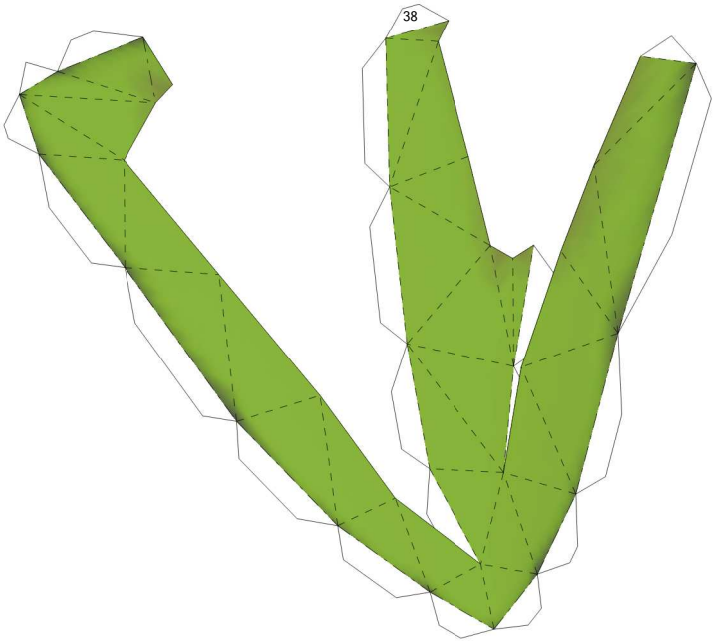


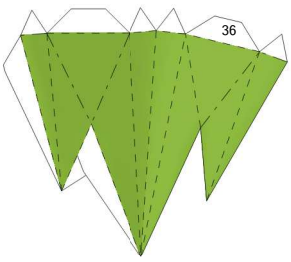


Start by the bigger spike.

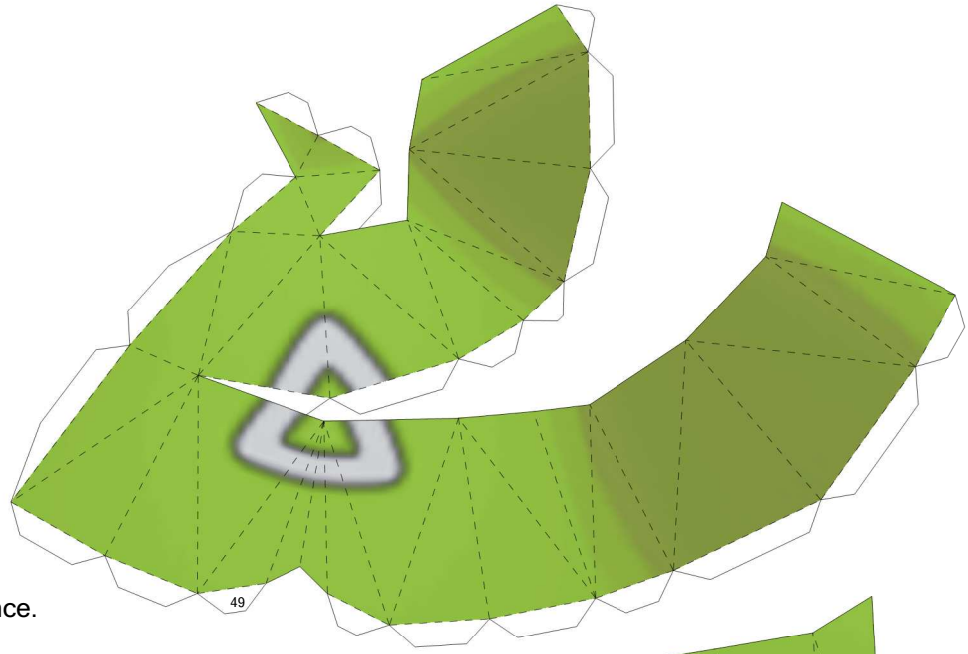


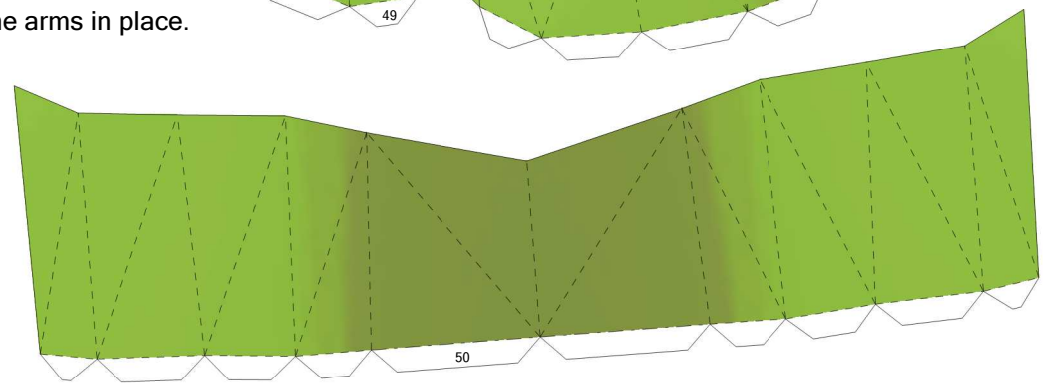


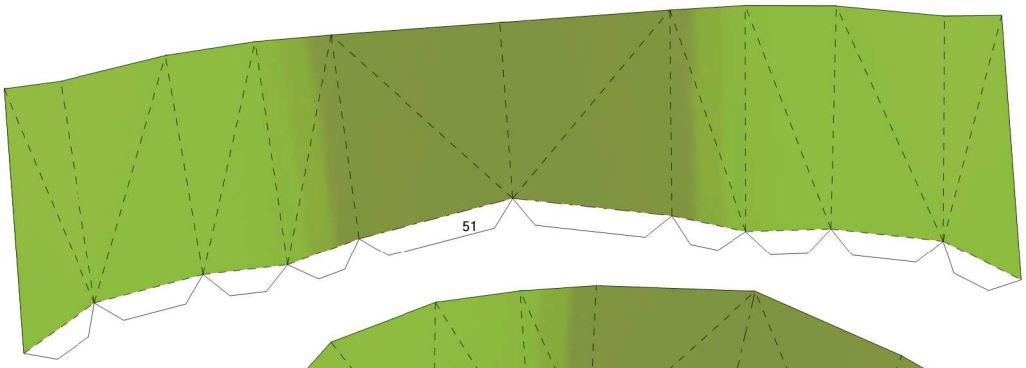


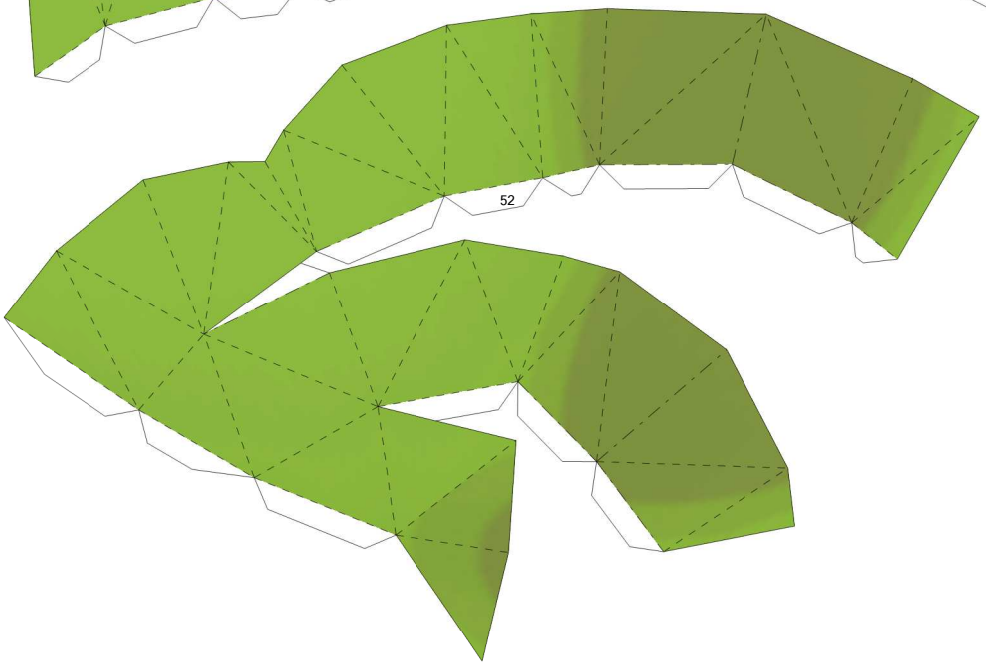


Joining the arms and the body is the trickiest part. Before you start the tail pieces, place the body at it's base, so as the arm you'll glue. Apply glue to the place where they'll connect and slide the body in place, always making sure the base is still in place. This will make it stand and hold the arms in place.

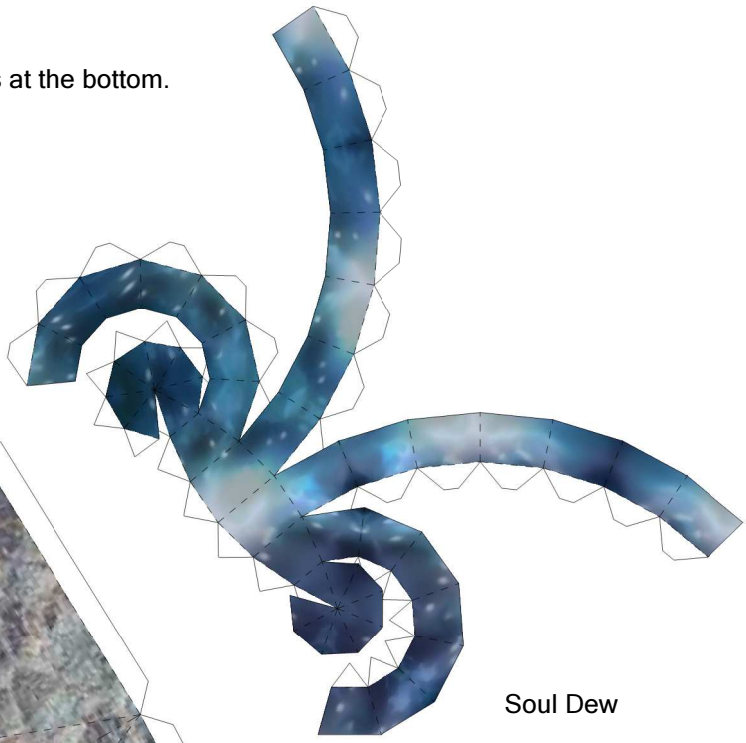








Close the balls at the bottom.

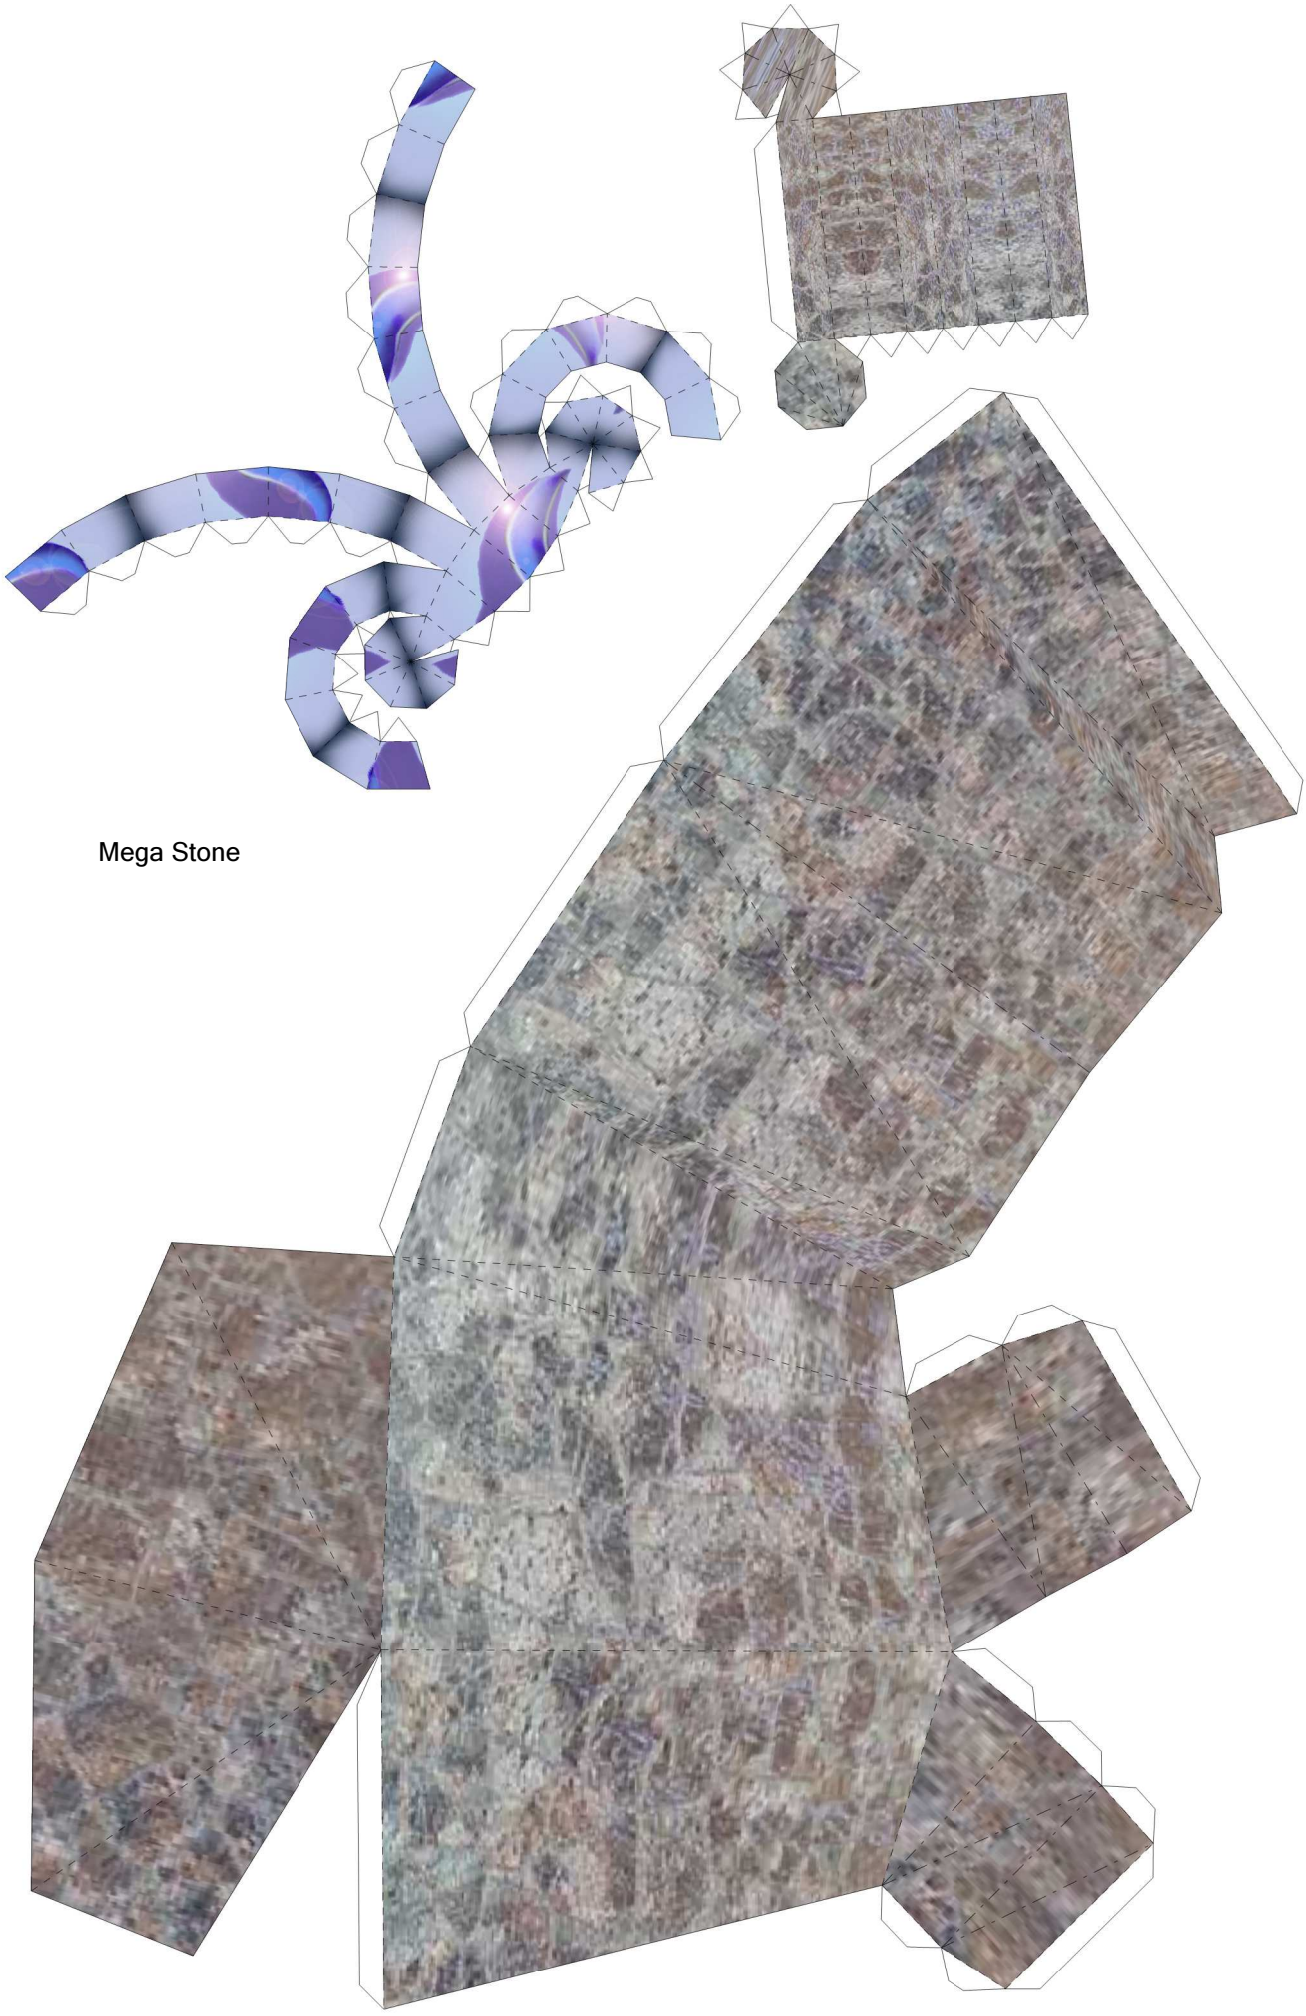


Soul Dew

Close the bases at the bottom and start by the top, where they'll connect with the body.

If you'll use the bases, use them as reference while gluing the arms to the body.

Bases indicated to support the arms weight.



Mega Stone
