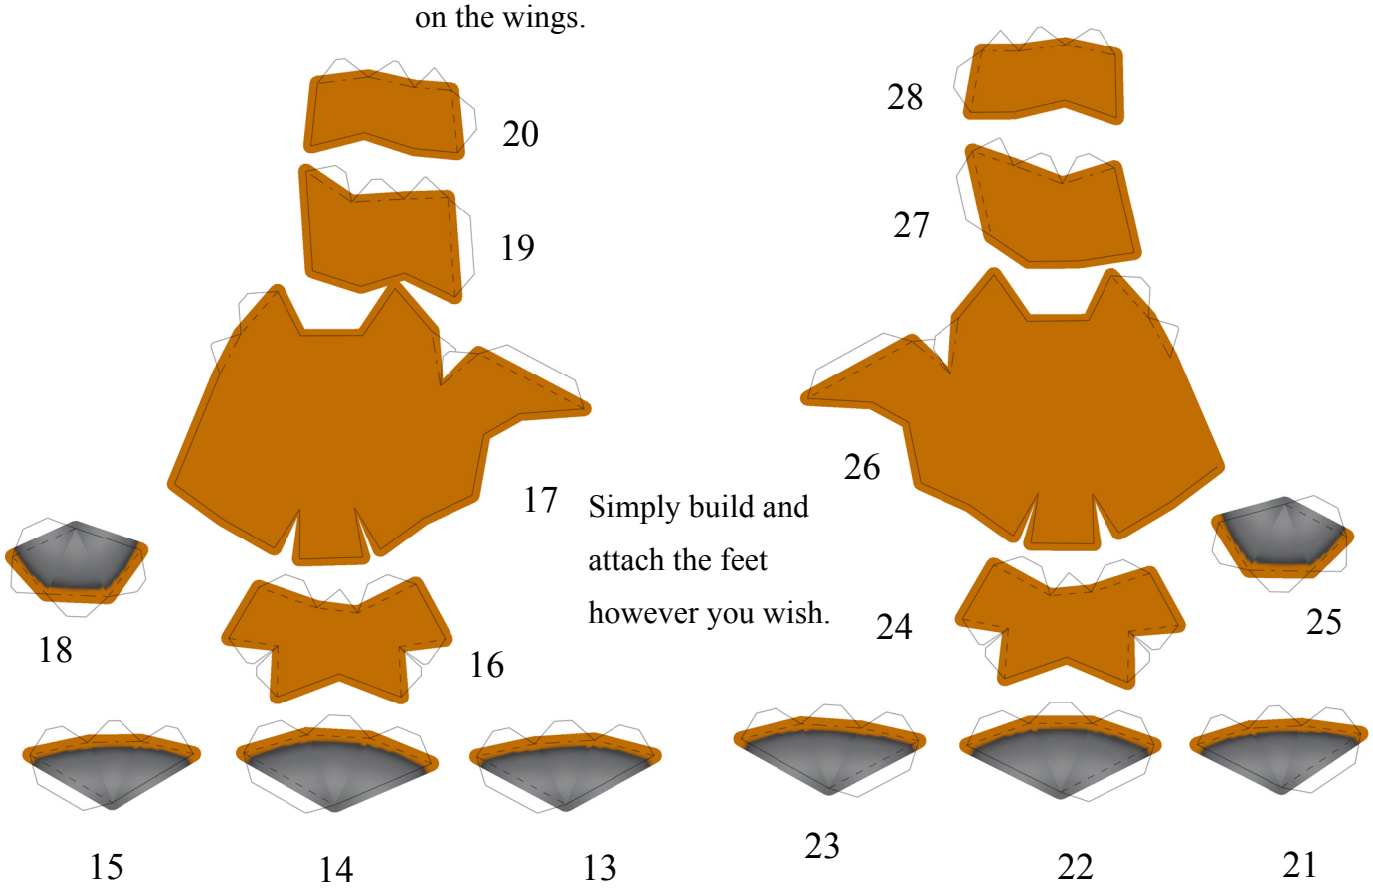
Swellow can be built in 2 ways, either:

1. Start from the head working your way down to the tail and then close the model at the wings.

OR

2. Start from the tail working your way up to the head then close the model by adding on the wings.



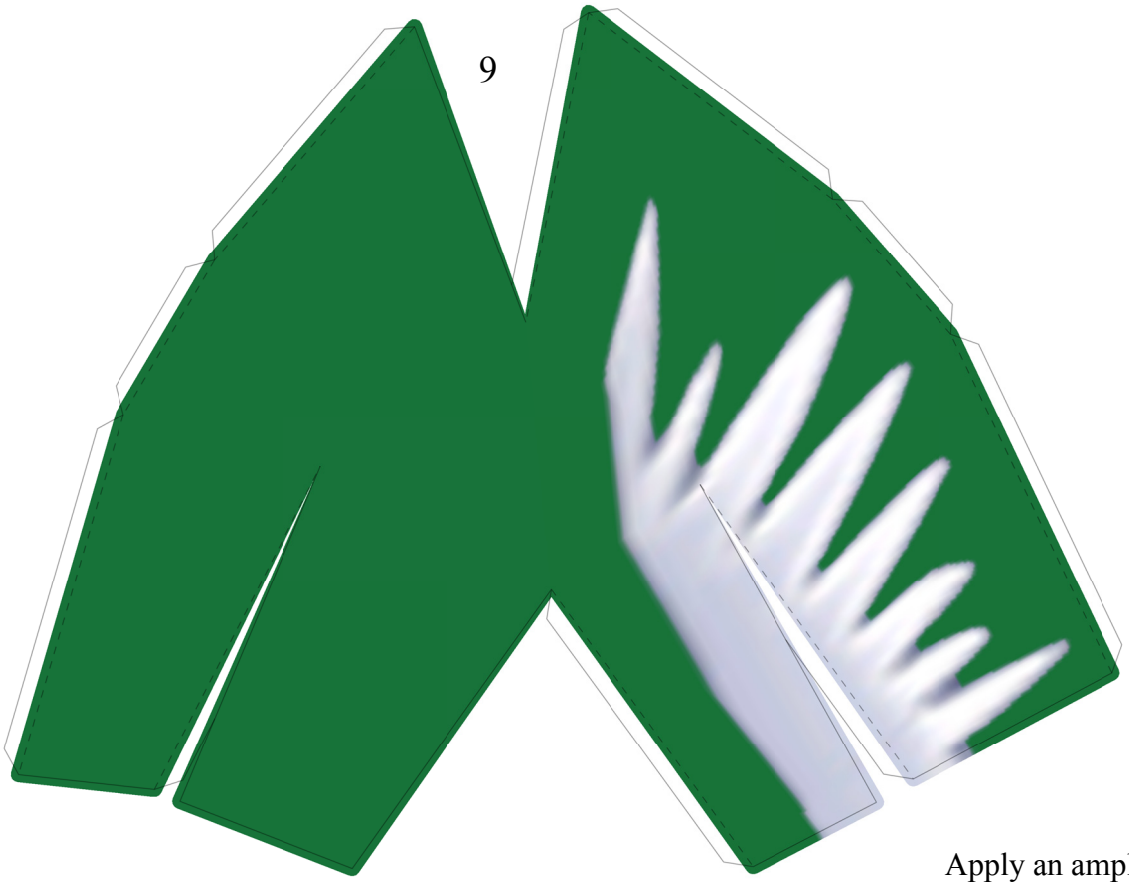
Simply build and attach the feet however you wish.

NOTE:

Both build methods work either you choose to build Swellow with the wings spread out or the closed wings.

The feet need to be aligned properly if you wish to build the standing version

9



In either method, the feathers
are the LAST parts to add.
Simply glue on the A side part first
followed by the B side.

Apply an ample amount of glue,
then once it dries just cut off
the excess texture and
you're done with the wings.

These parts are optional. Print only if you wish to have a standing Swellow rather than a flying version.

Attach part 1 and 2 to the body where the wings are meant to go.
