Pick one set of blades for the helmet

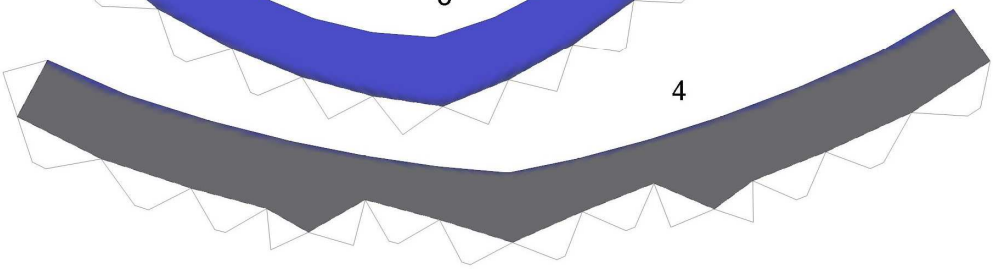

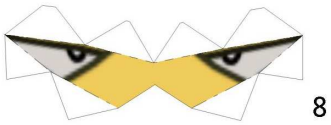

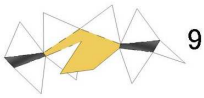

Build the left side of the 3D blade with A and B and close using the right side.

Build the outside of the helmet and add the inside part after. Use the tabs on this piece to close it.

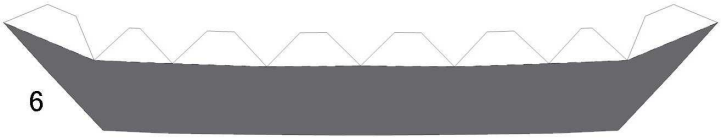

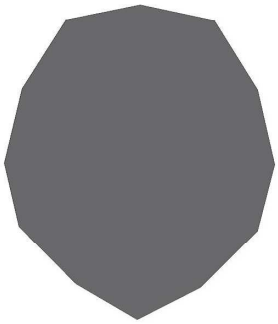

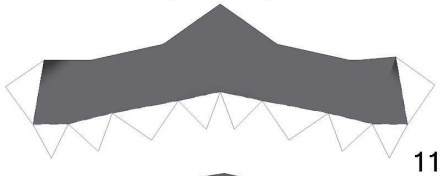

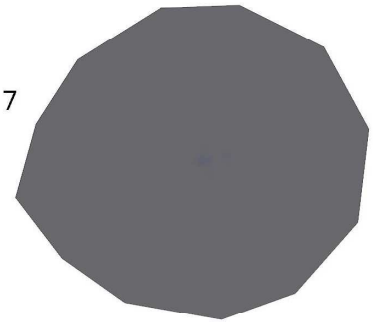

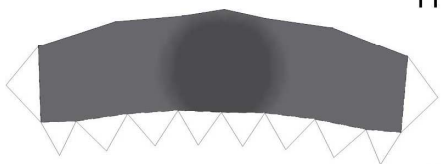

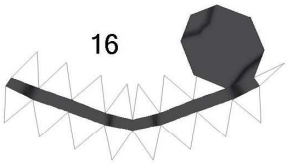

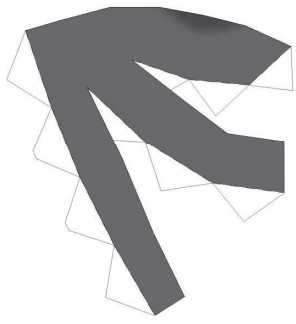

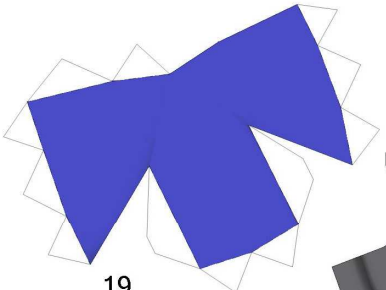

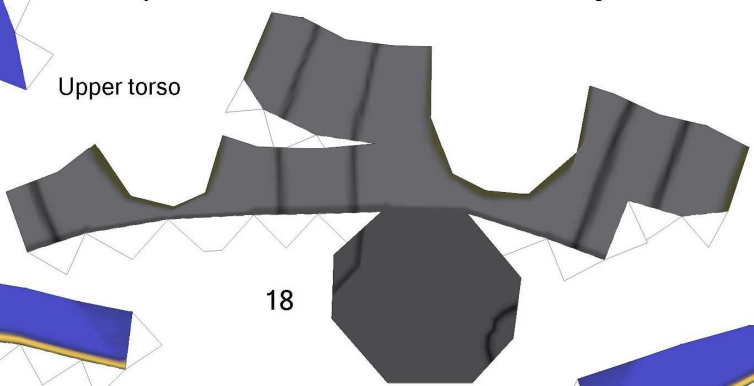

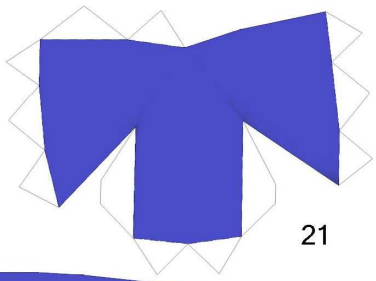

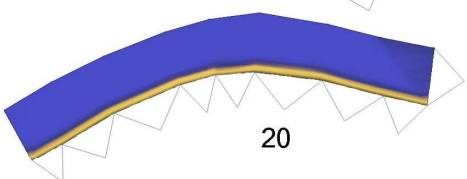

Only close the back after BOTH shoulders are glued.

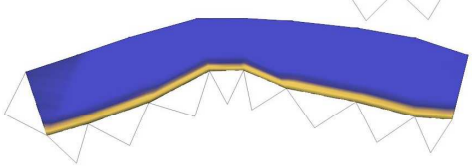

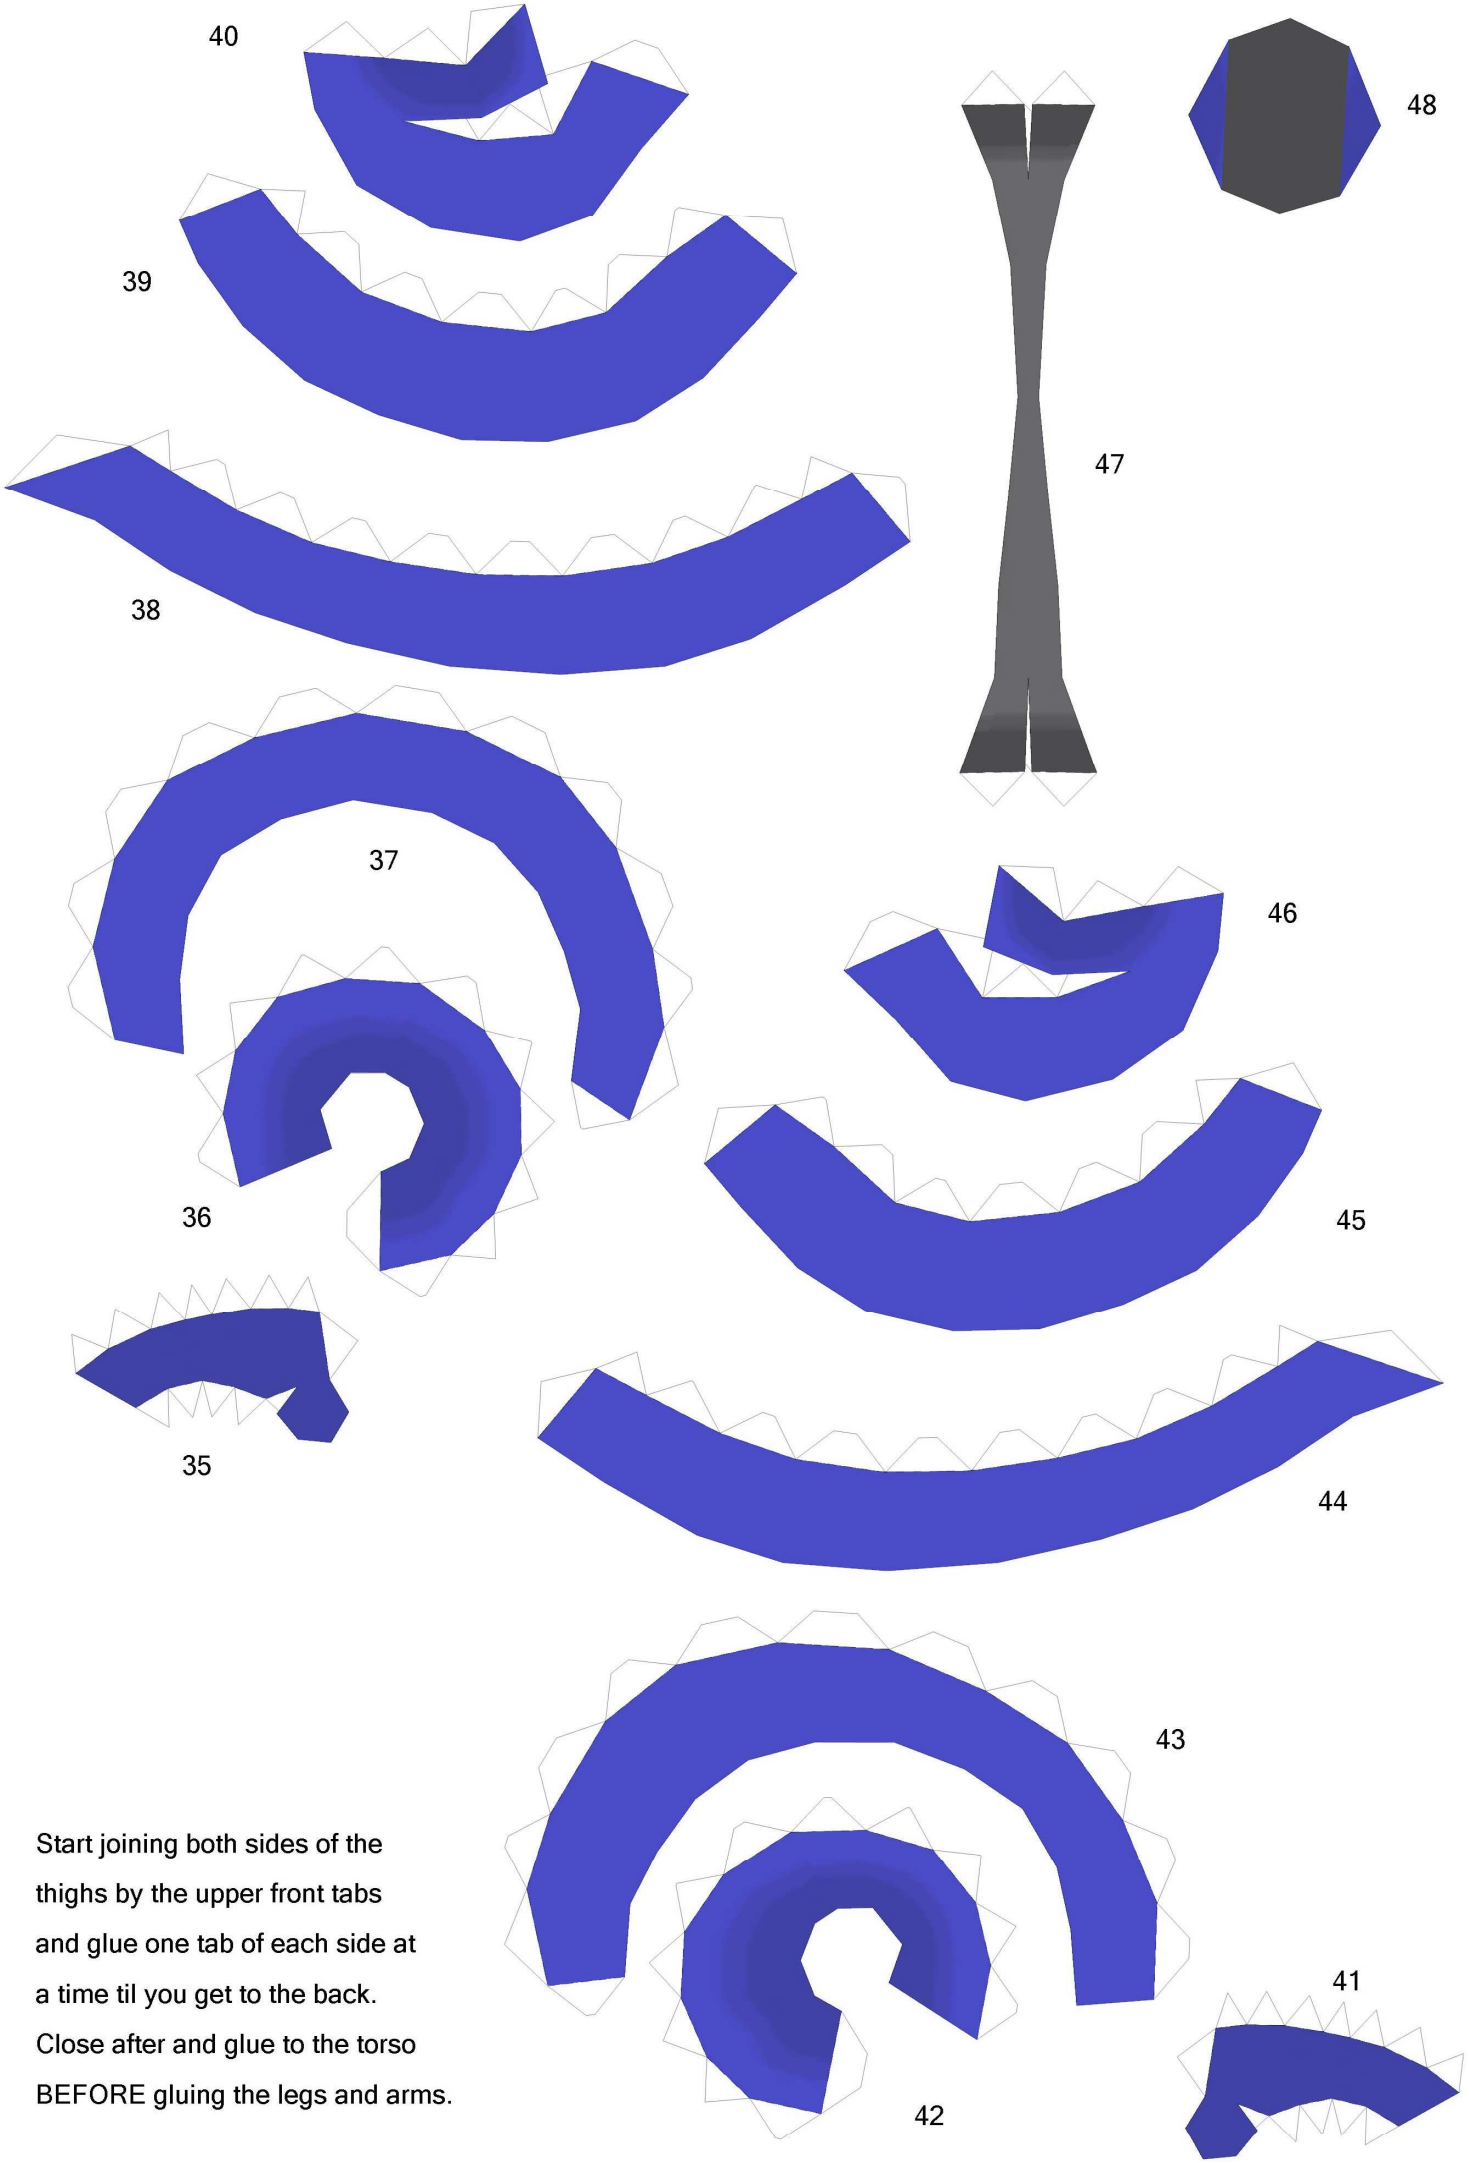

Upper torso

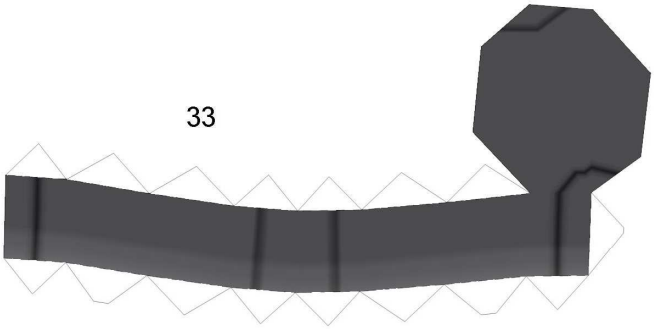

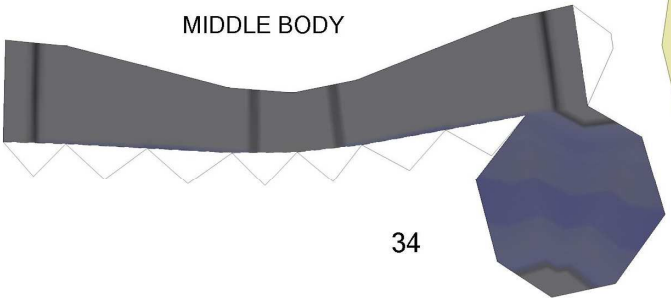

Start joining both sides of the thighs by the upper front tabs and glue one tab of each side at a time til you get to the back. Close after and glue to the torso BEFORE gluing the legs and arms.

Glue the 2D parts of the blades together. After that, glue the top of the blades to the previous set, using glue on the edges.

MIDDLE BODY

34

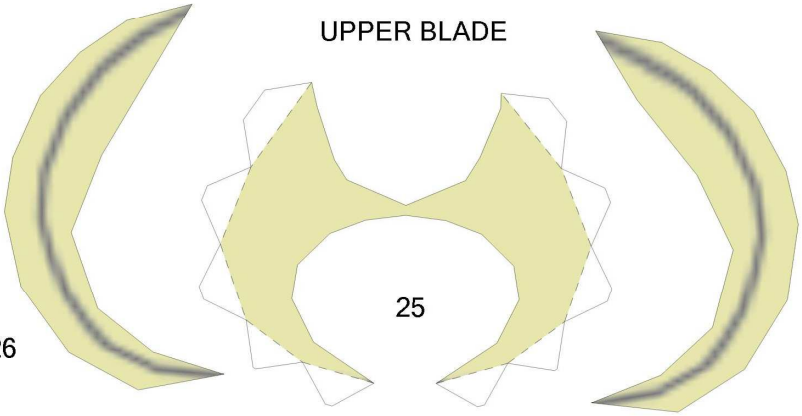

23

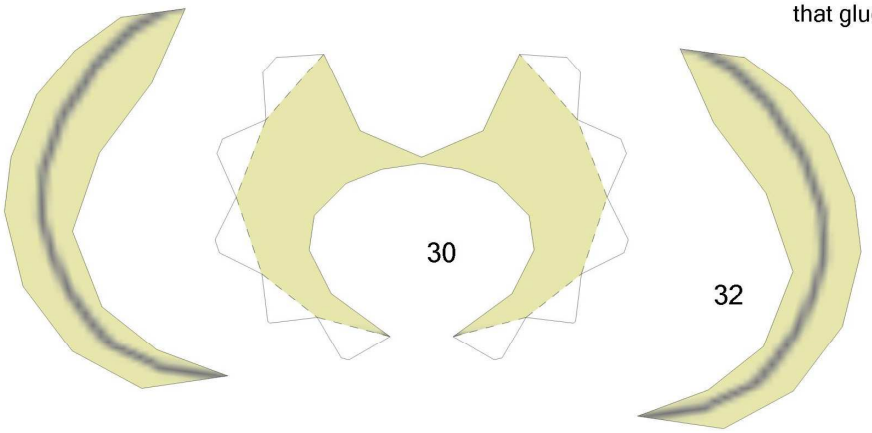

24

UPPER BLADE

26 25 27

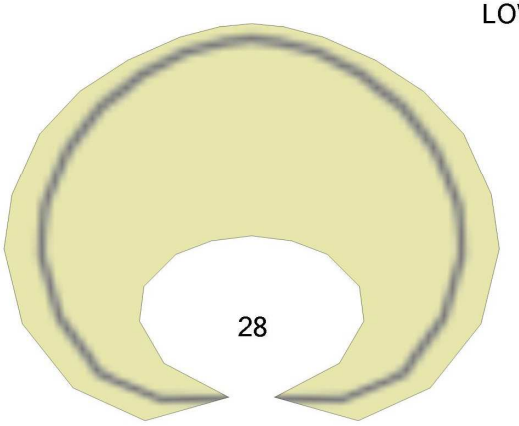

After the upper torso is built, build the upper blade, glue them to the upper torso, than glue the middle body to the bottom of the blade (using the lines at the back as a reference). After that glue the lower blade.

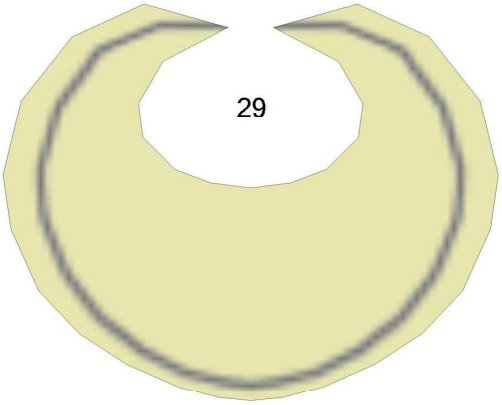

31 30 32

You might have to force the inside of the blades details so they can get the right shape. Use something to curl them.

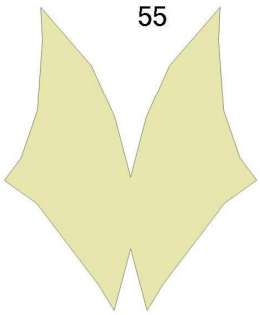

LOWER BLADE

Glue the blades and finger to the hand before gluing them to the arms. The arms must be glue to the body BEFORE you glue the hands to them.
You can pose the arms as you like.

You'll need to put some weight inside the feet, I used corn.
