

Cubone V2

By PODragon

Build by LuIS

PaPerPokés
www.pokemonpapercraft.net

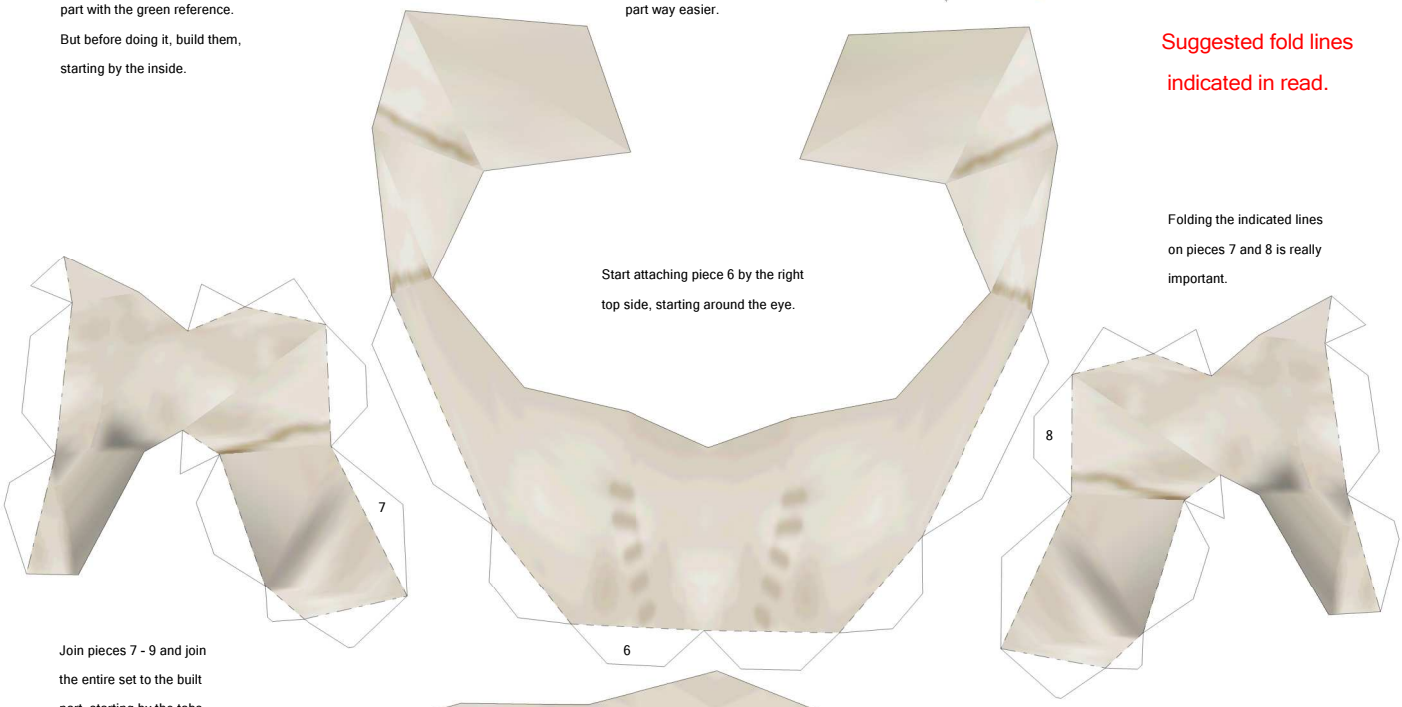

Only glue the front of piece 1 to itself after both of the eyes are glued.

Start attaching the eyes by the part with the green reference. But before doing it, build them, starting by the inside.

Start the head by the top and work down. It can offer some tricky parts, folding the indicated lines make this part way easier.

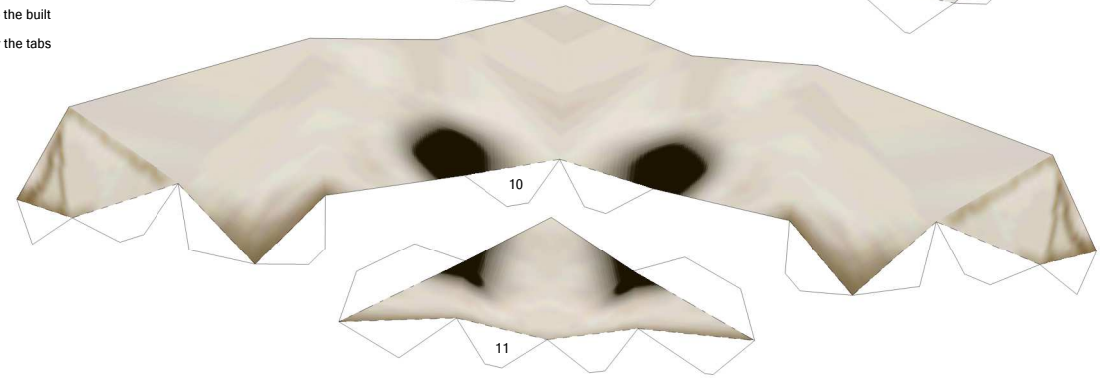

Suggested fold lines indicated in read.

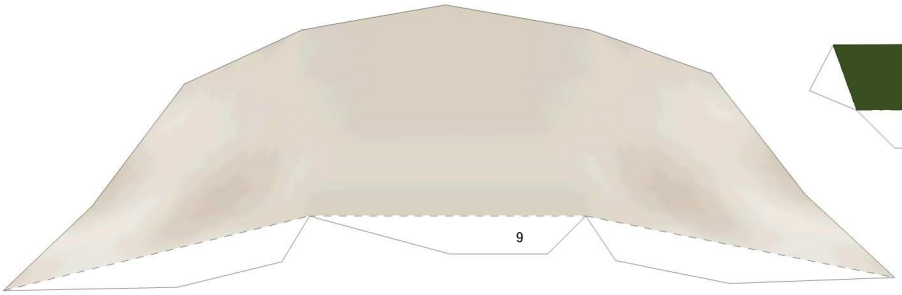

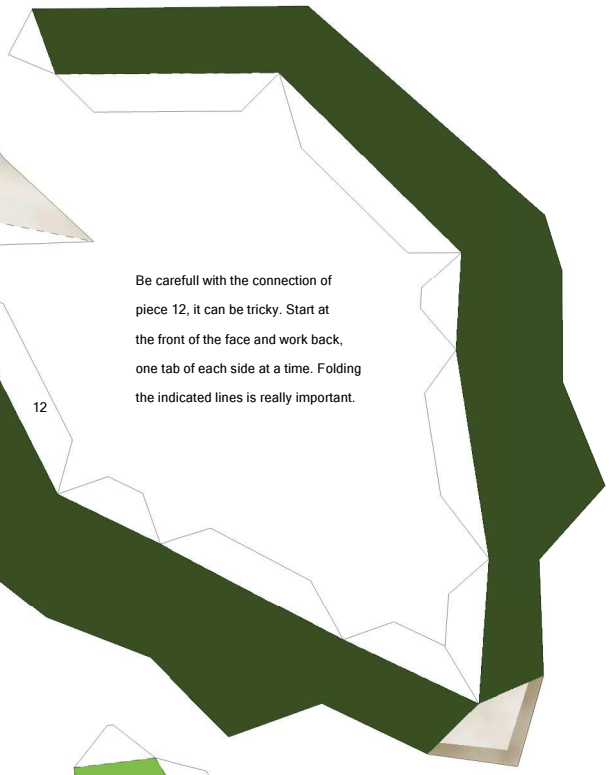

Start attaching piece 6 by the right top side, starting around the eye.

Folding the indicated lines on pieces 7 and 8 is really important.

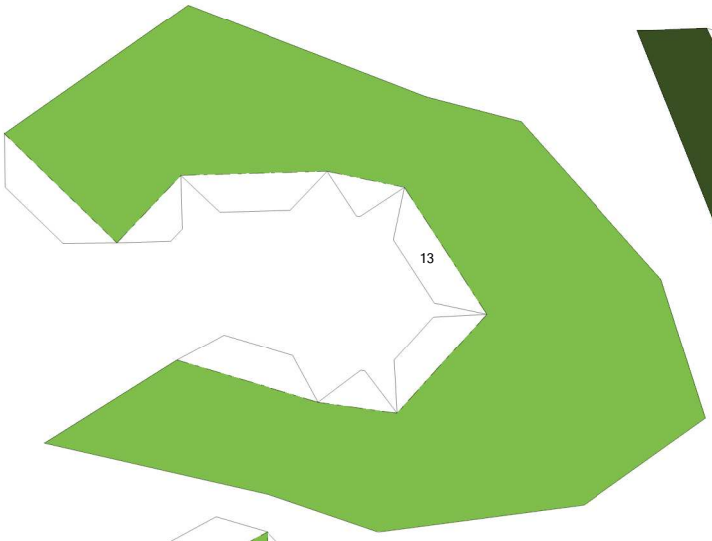

Join pieces 7 - 9 and join the entire set to the built part, starting by the tabs of piece 7.

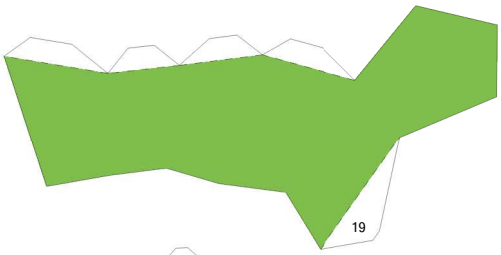

Be carefull with the connection of piece 12, it can be tricky. Start at the front of the face and work back, one tab of each side at a time. Folding the indicated lines is really important.

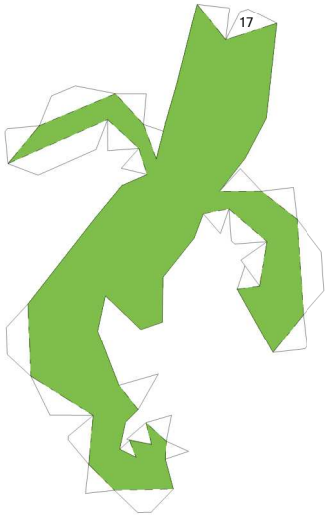

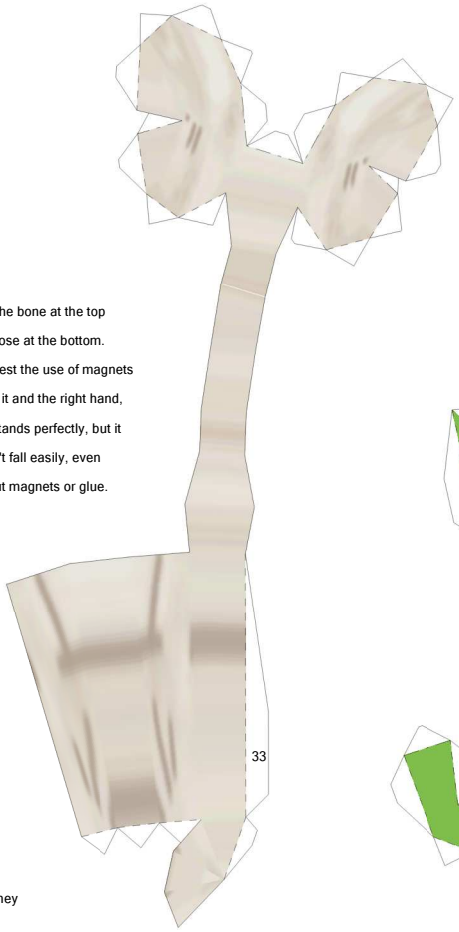

Start attaching pieces 14 and 16 by the green reference line.

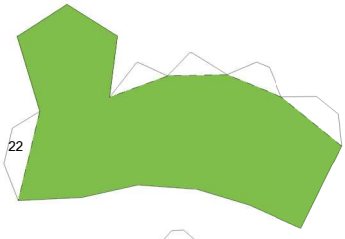

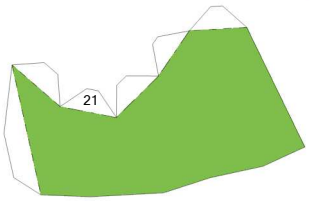

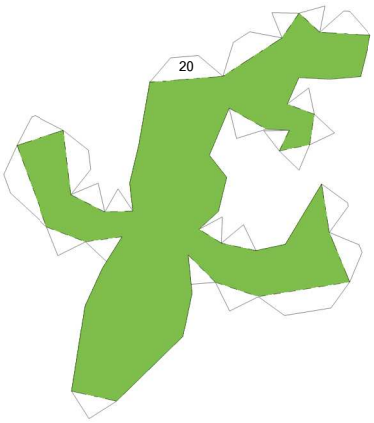

Start the bone at the top
and close at the bottom.
I suggest the use of magnets
inside it and the right hand,
so it stands perfectly, but it
doesn't fall easily, even
without magnets or glue.

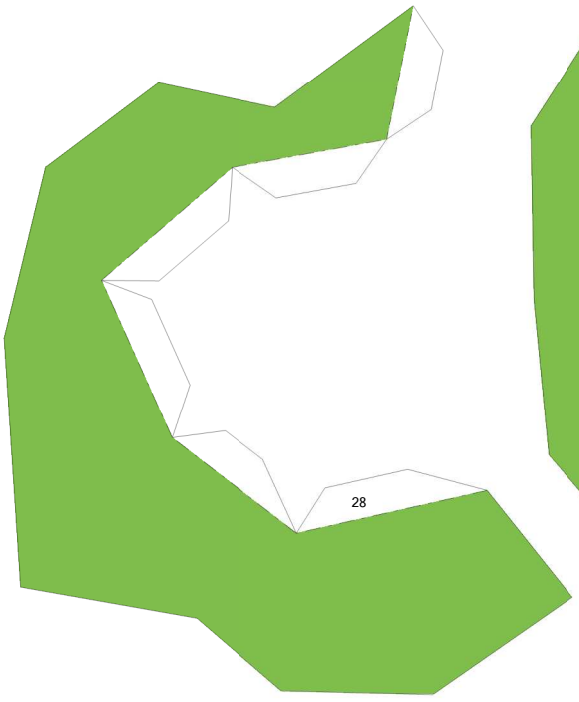

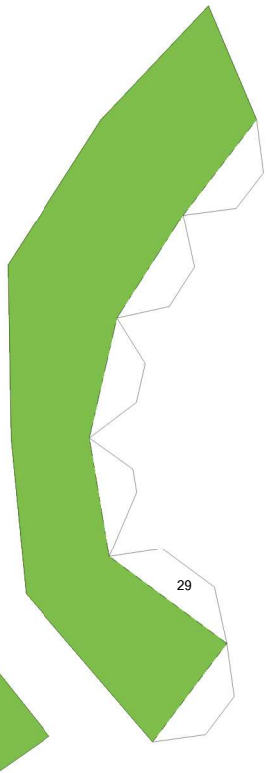

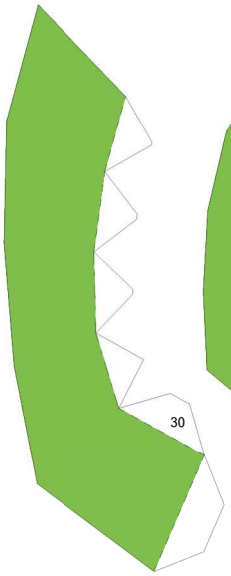

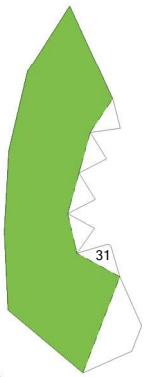

Start the arms at the hands.
Be carefull with them, first
build the inside of the hands,
only after glue the outside.
Some lines MUST be fold. They
are indicated with a red line.
Use of the pdo can be usefull.
After they are build, you can place
them anyway you want on the
body. But be carefull with the right
hand, so the bone don't touch the
skull. Glue them as soon as they are
ready, but before the tail is glued.

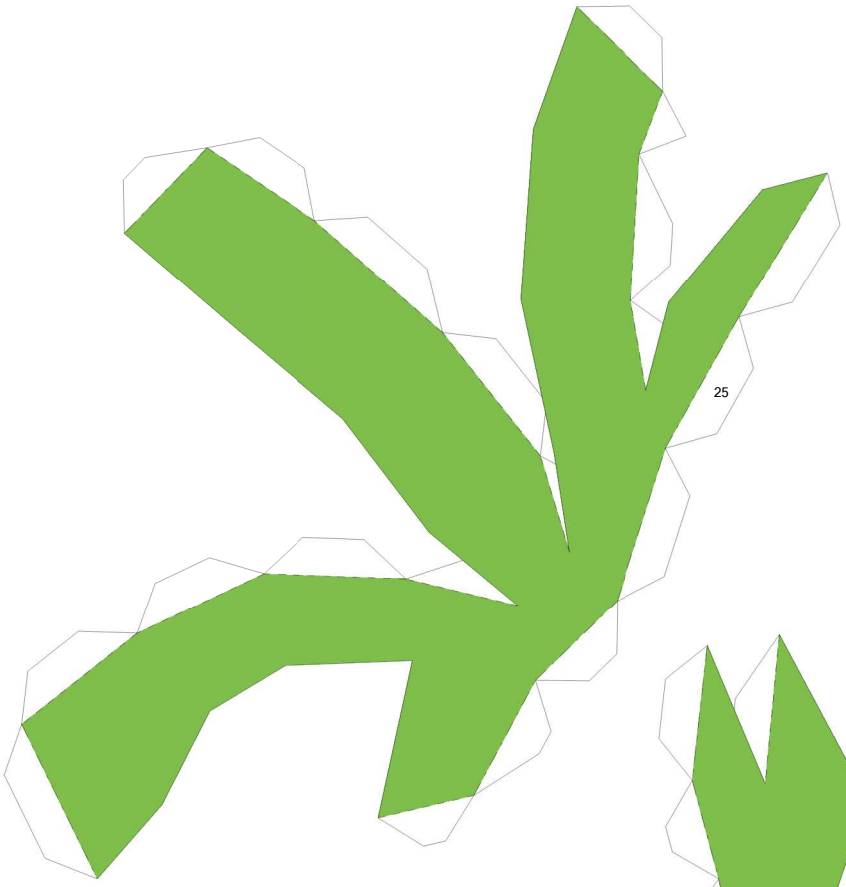

Close the model at the tip
of the tail.

Start the legs at the feet and work them up.
