Instructions

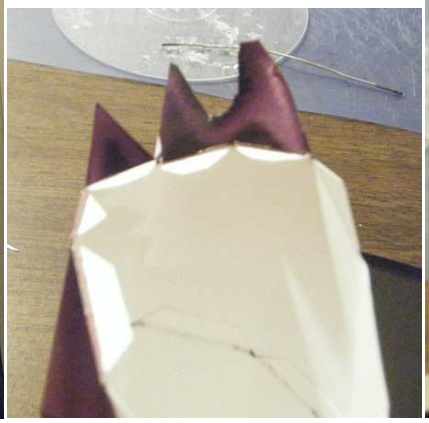

THE LEFT LEG: Build up the foot, as you get to the ankle, start preparing the spikes. Kain's leg spikes are flat, so basically double side them, and spread the flaps. Take piece 6 and 7 and make slits in them so that you can push the spike through and glue it. Look at the PDO for additional reference of where to cut the spikes.

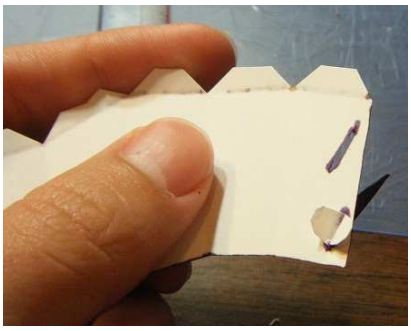

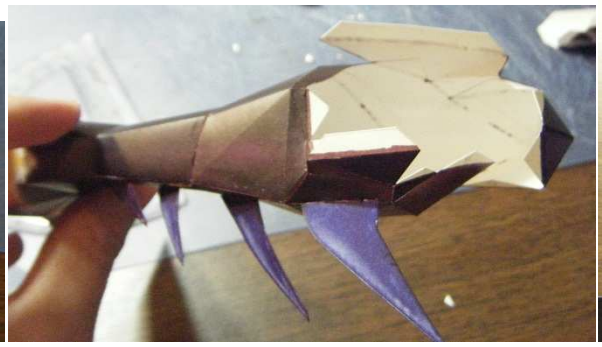

Glue the flaps to the inside. Then attach them to the ankle, and repeat the process for piece 7. Continue to build upward towards the knee.

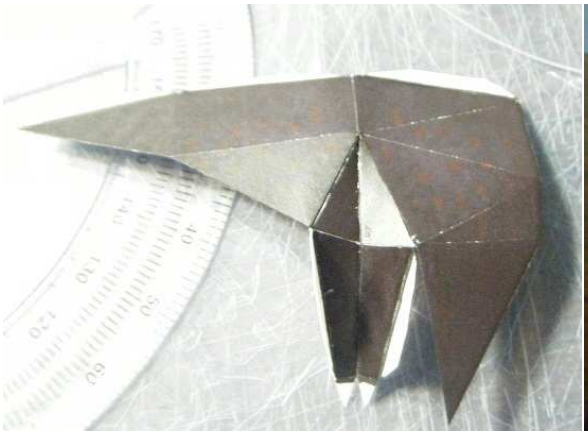

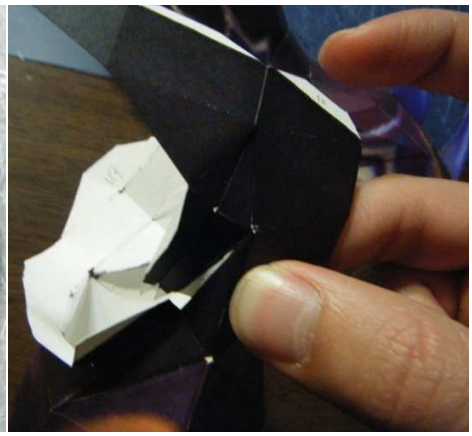

Continue building up the leg. Attach 15,16, and 17 to piece 14, . doubleside them and trim away the excess. Keep attaching 18-21.

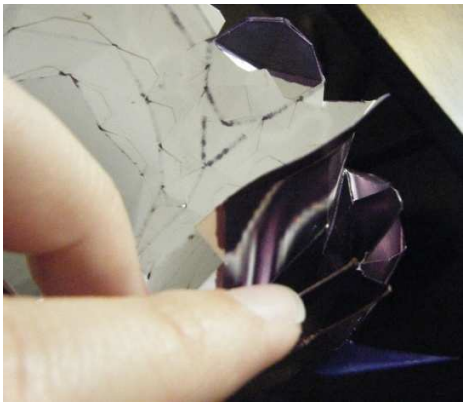

For the Right leg, do the same thing to handle the leg spikes. But basically follow the same upward motion (to piece 46) as the left leg.

Start assembling the butt/joining part (47-49). Then start attaching the legs to this joint part. And attach part 50 to take care of the crotch.

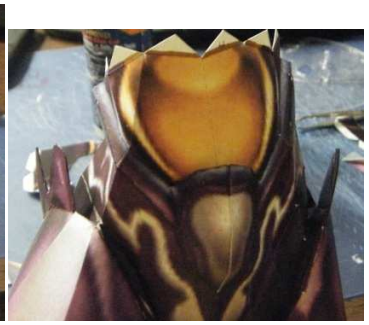

Here are some other angles to help you see how they can be attached.

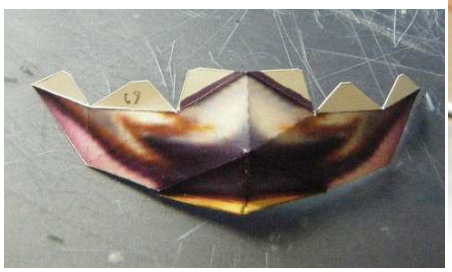

Build up part 51-53. And start to work with 56 and 57 towards the back. Connect and double side 0t1,0t2 as well as it1 and it2, trim the excess and attach the flaps to the top of piece 49. Don't fold over the flaps, just glue the flaps on top of them. Next thing is to attach 54 and 55 on top of the tail piece.

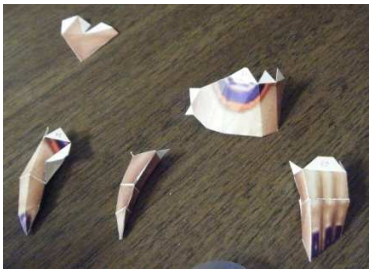

Attach the final parts of 56 and 57 to the top of parts 54 and 55. Then start building up 58 and 59 and 60. Then attach 61 the stomach.

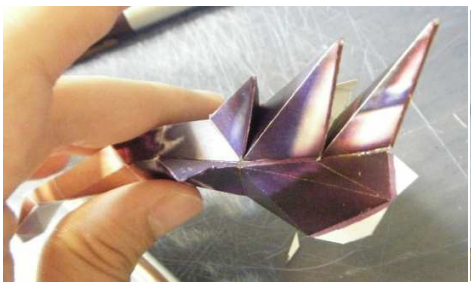

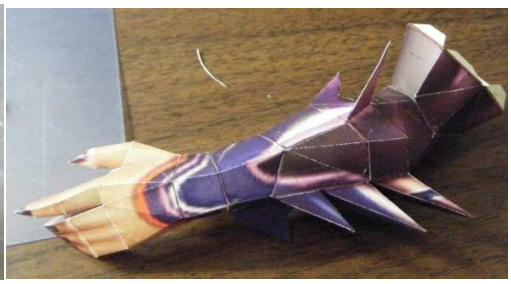

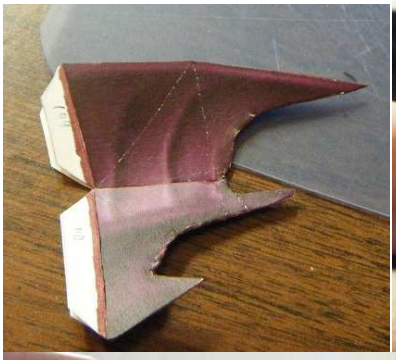

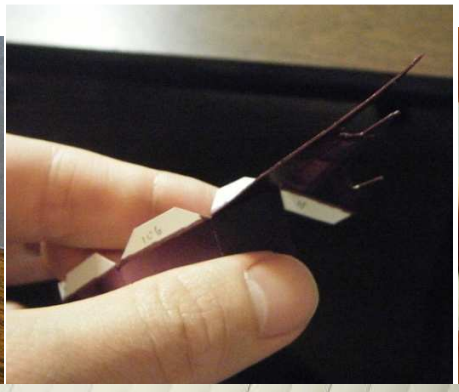

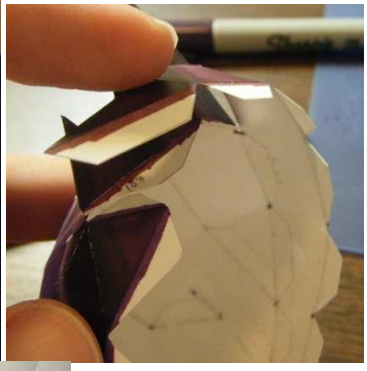

Attach 62 to 63-66, then attach it to the body. Fold together piece 67. NOTE: yours will look slightly different, I edited the piece so it'd be easier to fold. Needless to say the piece will attach the same. Then attach 68-72, and glue it to the back. So all we have left is the arms and head.

The Left arm

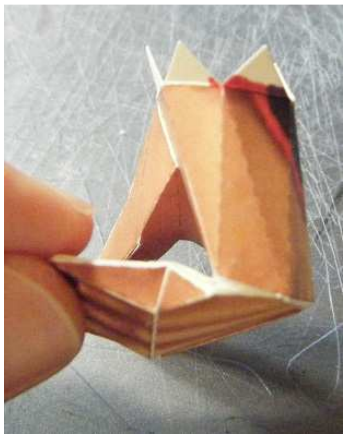

Construct all the fingers first, then the palm and back of hand, work up the fore arm, attaching all the spikes. Double side pieces 92-93 and 95-96. Don't glue the tabs together though, we're going to do the same thing that we did before with the leg spikes, however they're going to connect part of the forearms. Refer to the PDO to see exactly how they line up. Continue building upward towards the shoulder. But before you complete the shoulder. Attach and double side 107-110. Don't glue the bottom flaps. (the exposed white part in the next picture. And we're going to do the same flap insert thing we've been doing for all the flat attachments.

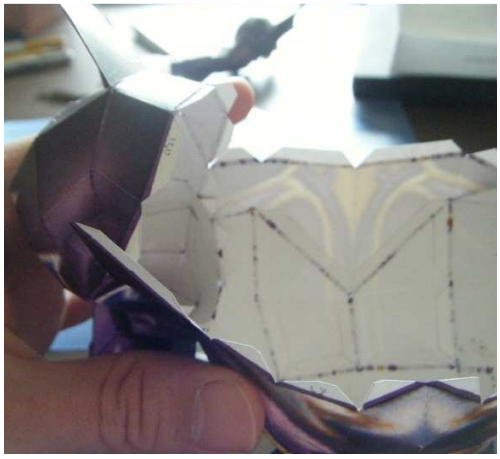

The other hand

The other arm is going to be the same, but the Right hand is a little tricky, it is “flattened” in one portion. But if I could manage to glue it together than you surely can! The rest of the upper arm is the same as the other arm.

Connecting the arm to the torso

Glue the arms to the armpits.

The Neck and Head

Connect the neck pieces first, then build upward with a jaw. Then start up the face. Then work on the bottom of the mask. Continue with mask. Double side the necessary pieces. The first picture below shows how you may have to twist pieces in a weird manner to glue them together.

But in the end, you should be able to glue the helm to the head.

Start attaching the “nose” of the dragon head, just glue one side and then roll it over to glue the other side. Next start gluing together the dragons face together to attach to the nose.

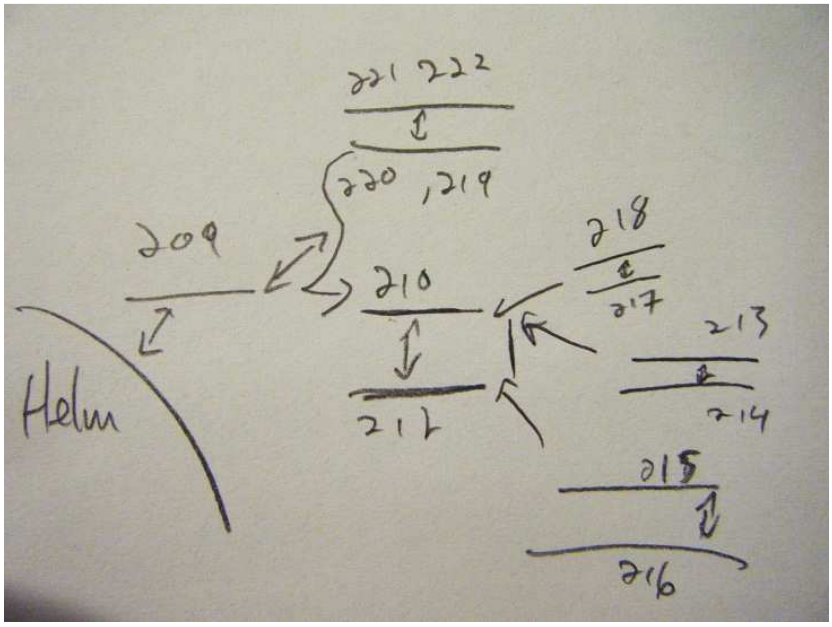

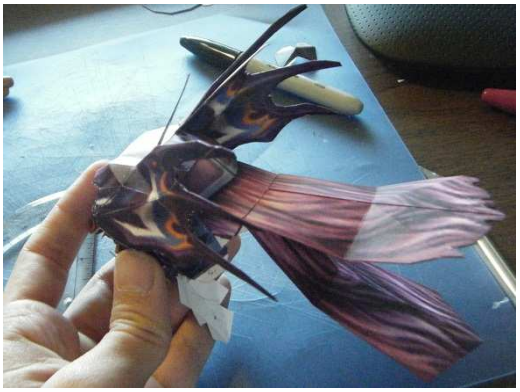

Glue the head of the dragon to the dragon’s nose. Next double side and trim the wing-like parts of the helm and glue them to the helm.

THE HAIR

Start double siding and trim the excess from the hair.

Below I've attached a figure to try to show you how I attached the hair. Look at the PDO and the pieces to get an idea of how they should fit together. Remember to just glue the tabs on top of each other, don't fold them over or anything like that.

so now that we have the head with the hair, we are about to start the next part.

Next we need to attach the neck/collar portion.

Glue the collar pieces from the outside to the inside…and we now have a completed Kain head.

So remember where we left off… now we need to put in his chest….

Next we just have to attach the parts that connect the collar and the shoulders. Start from the front to the back. You should end up with a small hole in the upper back. The last 2 pieces are 235 and 236, attach them and you should now have your Kain model.

But he can’t stand on his own. So we’ll build the stand.

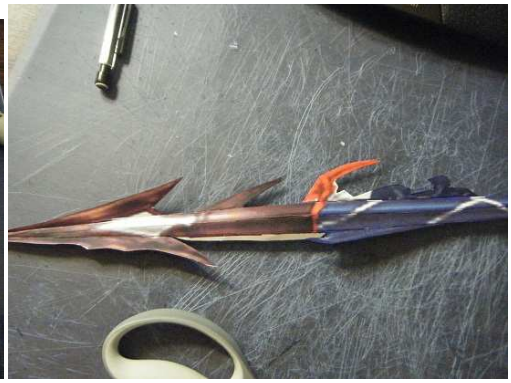

THE STAND

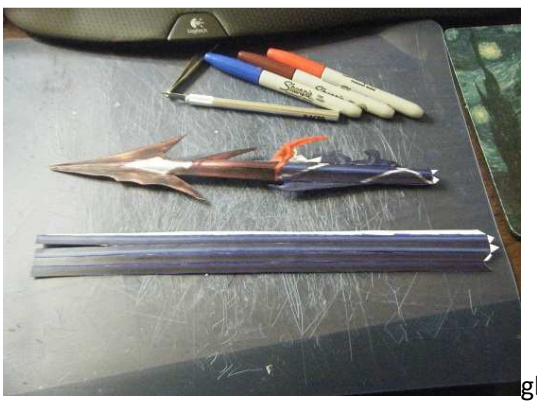

Follow the PDO, I didn’t take any intermediate pictures, but it’s a 1-pager and very straight forward. And glue Kain’s foot to it, he should stand on his own, but if not mess with the base, and you should be able to get it to stand up. As an alternative, you could cut a whole in the bottom of his foot, and in the base and insert a wooden dowel or something.

THE LANCE

Double side all the pieces on pages 1 and 2, trim the excess. Basically in this PDO, pages 1 and 2 are mirror images, where the numbers correspond to the same piece, and the letter corresponds to the “other side” We’re going to be doing the same thing as the leg spike so don’t cut off the flaps.

glue together the middle portion of the lance and attach it to the tip of the lance.

Start constructing the backend of the lance, once again the numbers are matched with the letters, but refer to the PDO. For the tassle and the small accessory, just glue them to the inside, or you can leave some excess before you trim the piece and use that to glue it in.

Second to last glue the end piece of the lance to the rest of the lance, and you should now have a lance.

Position the lance in Kains hand and you should end up with…..

KAIN…

Competition is what drives us…
