Kefka instructions

Right leg:

Build pieces 1-21

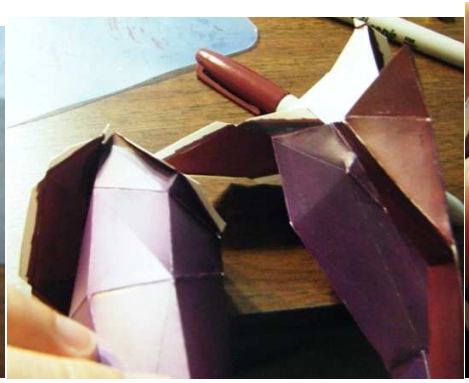

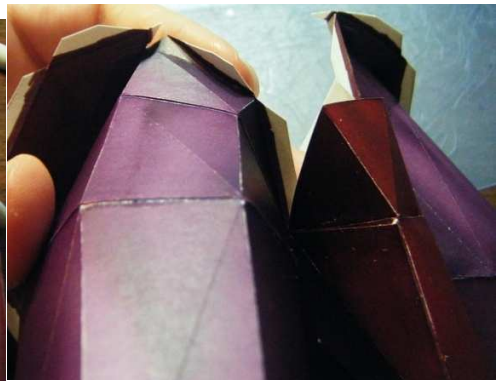

Left Leg:

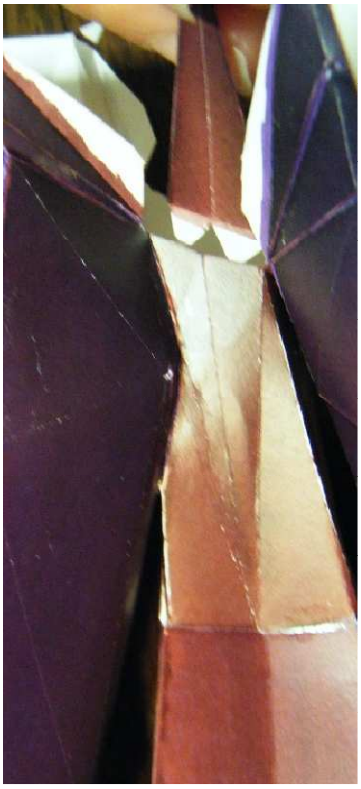

Build pieces 22-43

Connecting the two legs:

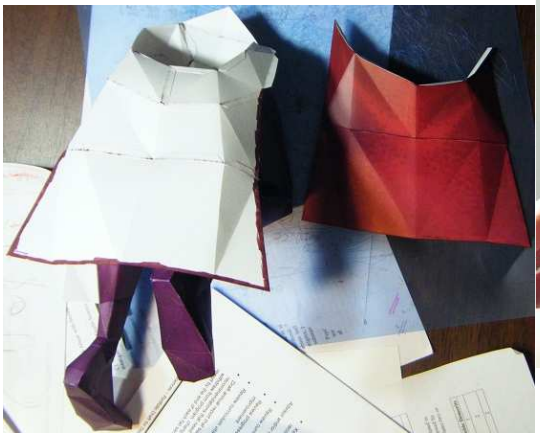

Start by attaching piece 44 to the bottom of the loin cloth on the left leg. Glue together 45, 46, and 47 and attach to the loincloth. Then glue the Right leg to the left leg by first attaching it to the loincloth. Then use piece 48 to attach the crotch. Then top it off with piece 49 and 50.

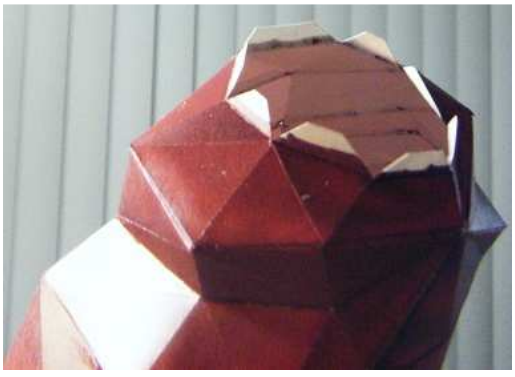

Attach pieces 51 and 52 to the main body. Now attach 53 and 54 together. (See picture)

Attach 55 and 56 together and to the outside part of the cape (53 and 54). Now attach this piece to the main part of the model.

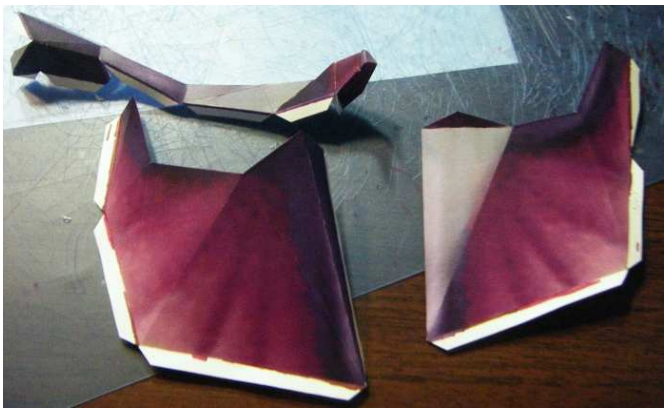

Continue up the model through piece 64 (the waist area)

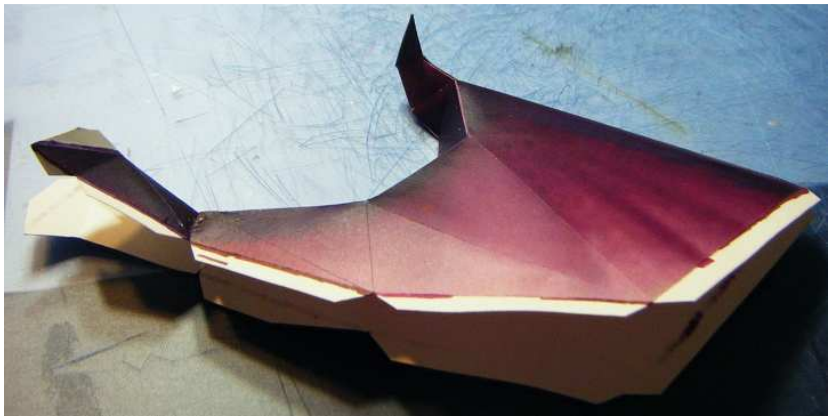

The Torso

Build up pieces 65-70 to complete the torso

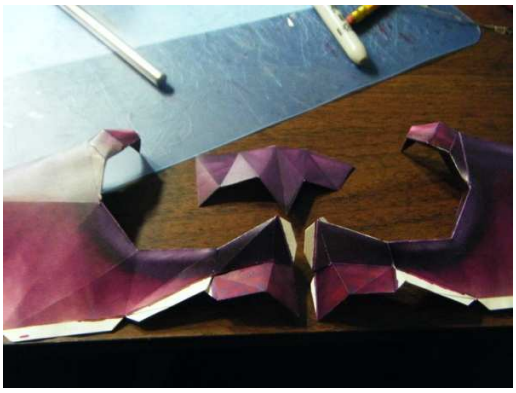

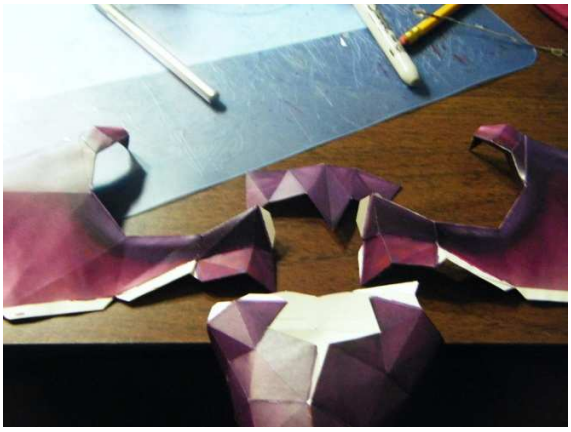

The Lower Demon Wings: You can do both of these at the same time since they're pretty much the same, just make sure that you keep track of which pieces correspond to which wing. Also I recommend making the wings out of regular printer paper since it is lighter. The main base of the wings on Page 9 are fine being build out of whatever weight of cardstock you're using since this will provide a good base. But I tried building the rest of the wings with cardstock and it was too heavy (at least without some form of support).

Build them both and cut out and the demon wing connector piece. The wing pieces are labeled left demon wing (LDW) and Right demon wing (RDW) correspondingly

Here is how the pieces will connect once you put them together

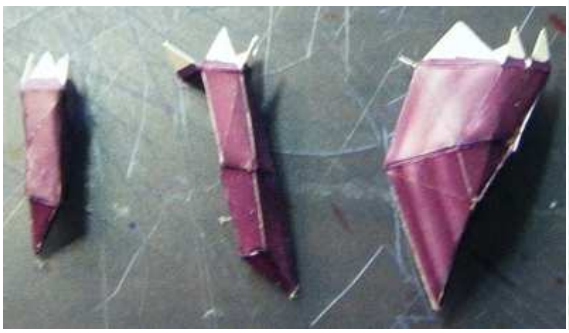

one wing at a time…

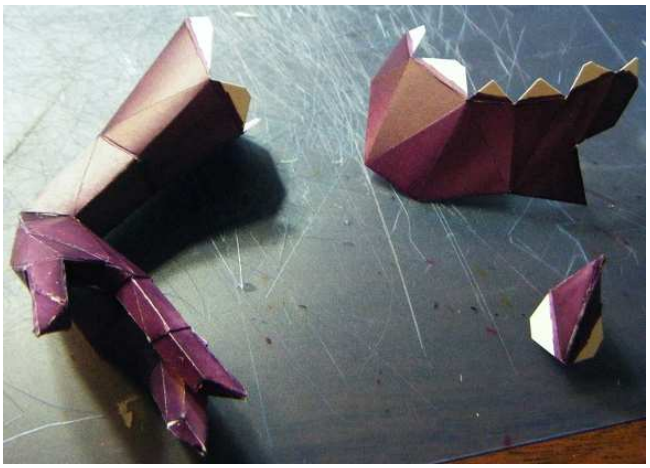

But I would recommend not attaching rdw6, ldw7, ldw5, and rdw7 until the model is completely built so that you can still move the model around freely.

The Hands and Arms:

Use the PDO to look at how to connect the Thumb, Index, other fingers, and palm.

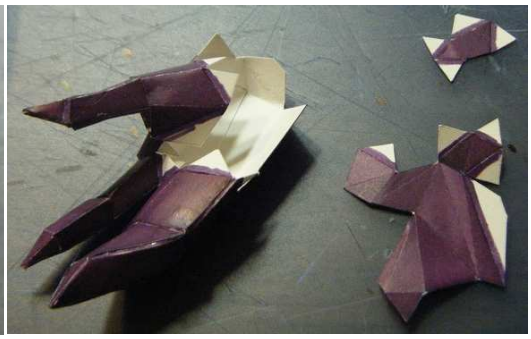

Then continue working up the arm lh1 to lh15,

Go ahead and attach the left arm..

Then basically follow the same format for the other arm (rh1-rh19)

build up the arm and attach it…

You should pretty much have the body without a head and the demon wings at this point.. So let's go ahead and prepare the head, then well start to attach it and the angel wings at the same time…

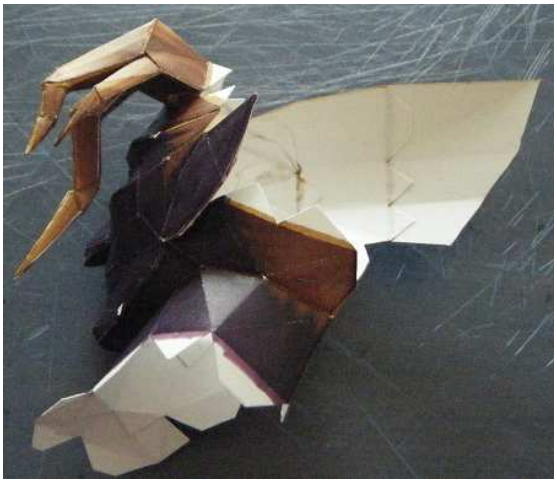

The Head (these parts are labelled with an “h”

Start with the neck from h1,h2 and build in sequential order until you get to the forehead h27,h28,h29

The next piece is h30,h31, which will be the outside of the right hair piece. Next thing we need to do is build the spikey hair pieces: H32-h40 and connect them together(refer to the PDO for which tabs connect to which). Then go ahead and attach it to the head…

Then go ahead and build up around the rest of the head and start preparing the red head piece that comes out the top of his head, h41-h60

The Angel Wings (Sorry no pictures….) Page 24 should be the only page that is printed on cardstock. Once again the other pages will be too heavy if built out of cardstock. But pretty much start with the base parts on page 24 and refer to the PDO to attach build the wings. I'd say build build pages 23-25 only and attach to the body, then attach the head from the front. (h1a to piece 70.) You should arrive at something like this…

Whereas he has a hole in the back of his neck where the two closing pieces will be inserted…insert it.

At this point we are done with maneuvering the model, so go ahead and start attaching the other parts of the angel wings, and the demon wings, I'd suggest one side at a time. Refer to the PDO to see where they attach and logically mke sense as the front and back pieces… trim some of the excess and you should arrive at this:

Now tie some support strings around both his arms and have them tied to gether in the back and hang him from the ceiling.

Life…dreams… hope… Where'd they come from? And where are they headed…? These things… I'm going to destroy!
