This model is really straight-forward, there are no many complications, just the spikes, that can be kinda boring because of the high number. Just make sure to follow the numbers. When placing the bottom spikes in special, make sure that the distance between them is the same, this way it'll stand easily. Refer to the pdo and the reference pictures with the placement of the spikes.

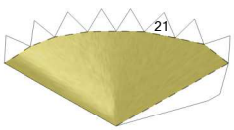

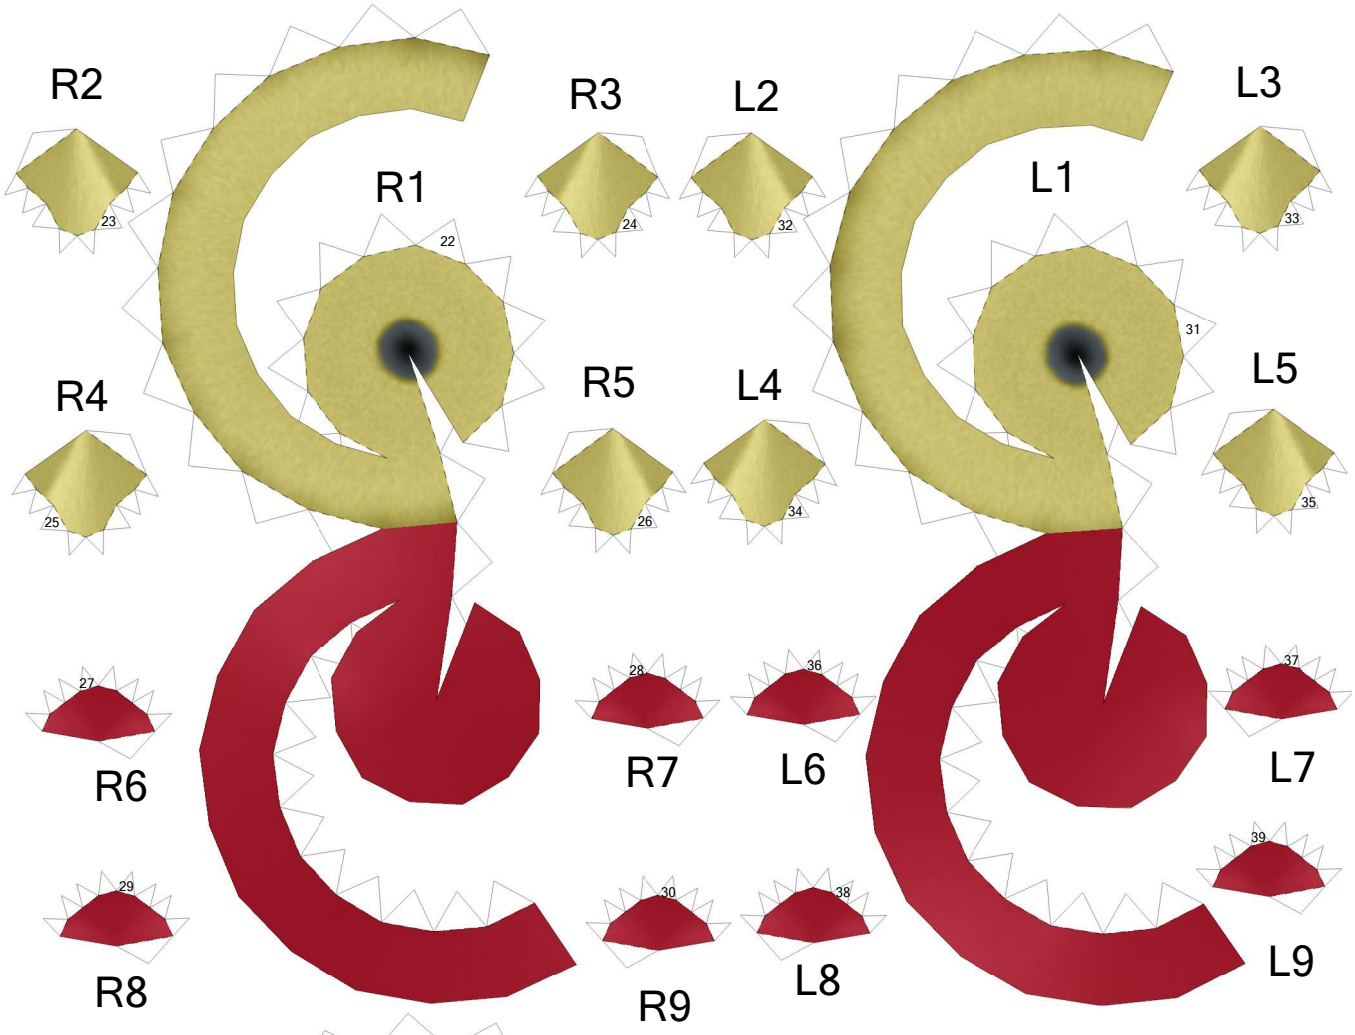

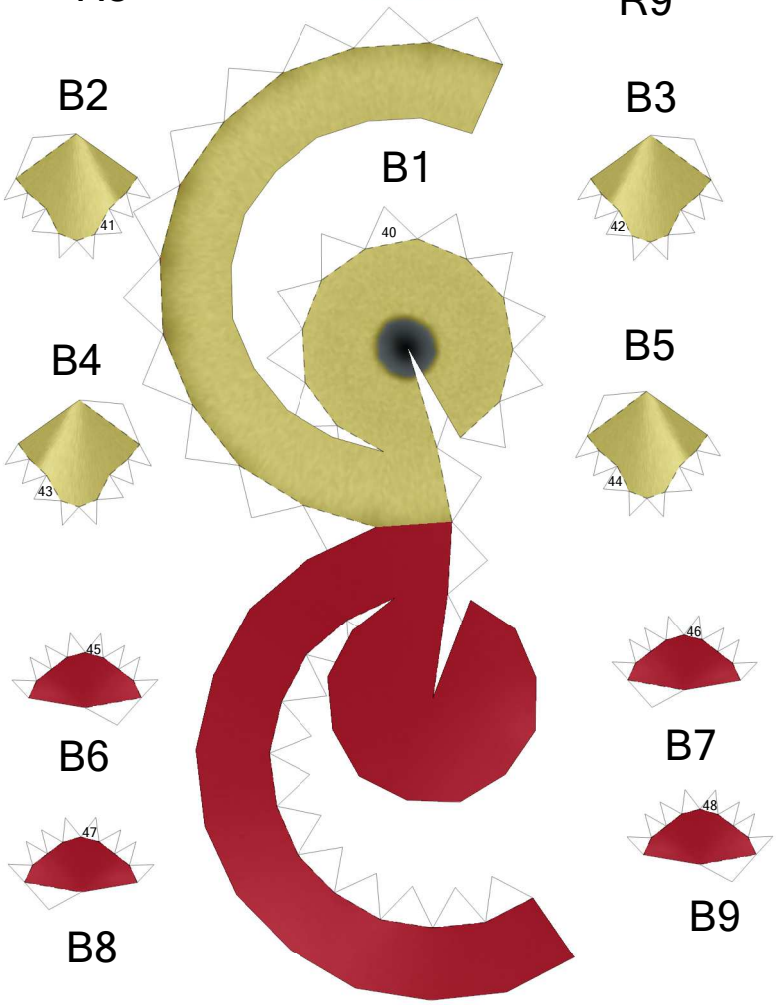

Refer to the pdo and the reference picture when attaching the spikes from 19 to 21, it's important since, if you choose the 1st set of tentacles, this is what make the model stand.

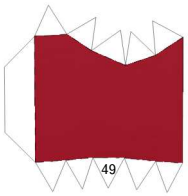

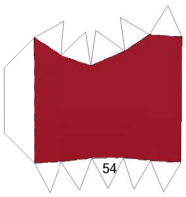

There are 2 options for the tentacles, one set going up (1st set and the one on the picture) and the going down (2nd set), be carefull in special with the second set, the model will stand on it and they have to be carefully placed so the model stand. Also, after some time, since the body is heavy, they can deform somehow. The plates are heavy and after a while since the model was built, the tentacles felt. I'd suggest no more than 120g/m² paper for this model for this reason, or a heavier paper for the body (pages 1 and 2) and a lighter for the tentacles and plates (3 and 4/5).

Follow the numbers when attaching the spikes to the body. The way it's numbered is the best way to get a better position and be able to aply presure from the inside.

When making the tentacles, choose one set or the other.
